Executive Summary

This study was conducted for the purpose of identifying the potential transportation impacts related to the proposed 128 Lorton Avenue residential development. The project is located in downtown Burlingame. The site is currently occupied by four residential units. The proposed project would replace the existing homes with a four-story residential building over an at-grade parking garage. The project would consist of 19 dwelling units. Access to the proposed project would be provided via a full-access driveway on Lorton Avenue to the parking garage.

The potential impacts of the project were evaluated in accordance with the standards set forth by the City of Burlingame and the City/County Association of Governments (C/CAG) of San Mateo County Congestion Management Program (CMP). The study includes an analysis of AM and PM peak hour traffic conditions during weekdays on two unsignalized study intersections in the vicinity of the project site. Potential impacts to pedestrians, bikes, and transit services were also considered.

Based on the project description, and trip generation rates recommended by the Institute of Transportation Engineers, it is estimated that the proposed project would generate 67 net new daily vehicle trips, with 4 net new trips during the AM peak hour and 5 net new trips during the PM peak hour.

The City of Burlingame does not have a Council-adopted level of service threshold, thus significance standards (such as LOS D or better) that have typically been applied in traffic studies and EIRs, were used. The results of the intersection level of service analysis under all scenarios with and without the project are summarized in Table ES-1. The results determined that under all scenarios with and without the project, both study intersections would operate at an acceptable LOS A or LOS B during the AM and PM peak hours.

This report provides the following recommendations for the project:

- Appropriate visible warning signs and audible warning signals should be provided at the parking garage exit to alert pedestrians and bicyclists of vehicles exiting the garage.
- Signs prohibiting parking during garbage pickup hours should be placed along the project frontage on Lorton Avenue.
- The proposed project should provide seven more parking spaces to meet the City's requirements.

- The proposed project should include 19 long term bicycle parking spaces and four short term bicycle parking spaces.
- The proposed puzzle stackers should be designed and installed to accommodate all typical passenger vehicles, including trucks, SUVs, and vans.

Table ES-1
Intersection Levels of Service Summary

Study Number	Intersection	Peak Hour	Count Date	Traffic Control	Existing				Background				Cumulative			
					No Project		with Project		No Project		with Project		No Project		with Project	
					Avg Delay (sec.)	LOS										
1	Lorton Avenue and Howard Avenue	AM	01/10/19	AWSC ¹	9.8	A	9.8	A	10.2	B	10.2	B	10.8	B	10.8	B

		PM	03/28/18		11.5	B	11.6	B	12.0	B	12.1	B	12.5	B	12.6	B

Note:

AWSC = All-Way Stop Control
TWSC = Two-Way Stop Control
¹ Average delay for an all-way stop controlled intersection is reported for the entire intersection.
² Average delay for a two-way stop controlled intersection is reported for the worst stop-controlled approach.

1. Introduction

This report presents the results of the Transportation Impact Analysis (TIA) conducted for the proposed residential development at 128 Lorton Avenue in Burlingame, CA. The project is located in downtown Burlingame (see Figure 1). The site is currently occupied by four residential units. The proposed project would replace the existing homes with a four-story residential building over an at-grade parking garage (see Figure 2). The project would consist of 19 dwelling units. Access to the proposed project would be provided via a full-access driveway on Lorton Avenue to the parking garage.

Scope of Study

This study was conducted for the purpose of identifying the potential transportation impacts related to the proposed development. The potential impacts of the project were evaluated in accordance with the standards set forth by the City of Burlingame and the City/County Association of Governments (C/CAG) of San Mateo County. The C/CAG administers the San Mateo County Congestion Management Program (CMP). Given that the project is expected to add fewer than 100 peak hour trips to CMP roadways (El Camino Real), a C/CAG trip reduction analysis was not prepared. The traffic study includes an analysis of AM and PM peak hour traffic conditions for two unsignalized intersections in the vicinity of the project site. The study also includes an analysis of site access and on-site circulation, vehicle queuing, and transit, bicycle, and pedestrian access.

Study Intersections

1. Lorton Avenue and Howard Avenue (unsignalized)
2. Lorton Avenue and Bayswater Avenue (unsignalized)

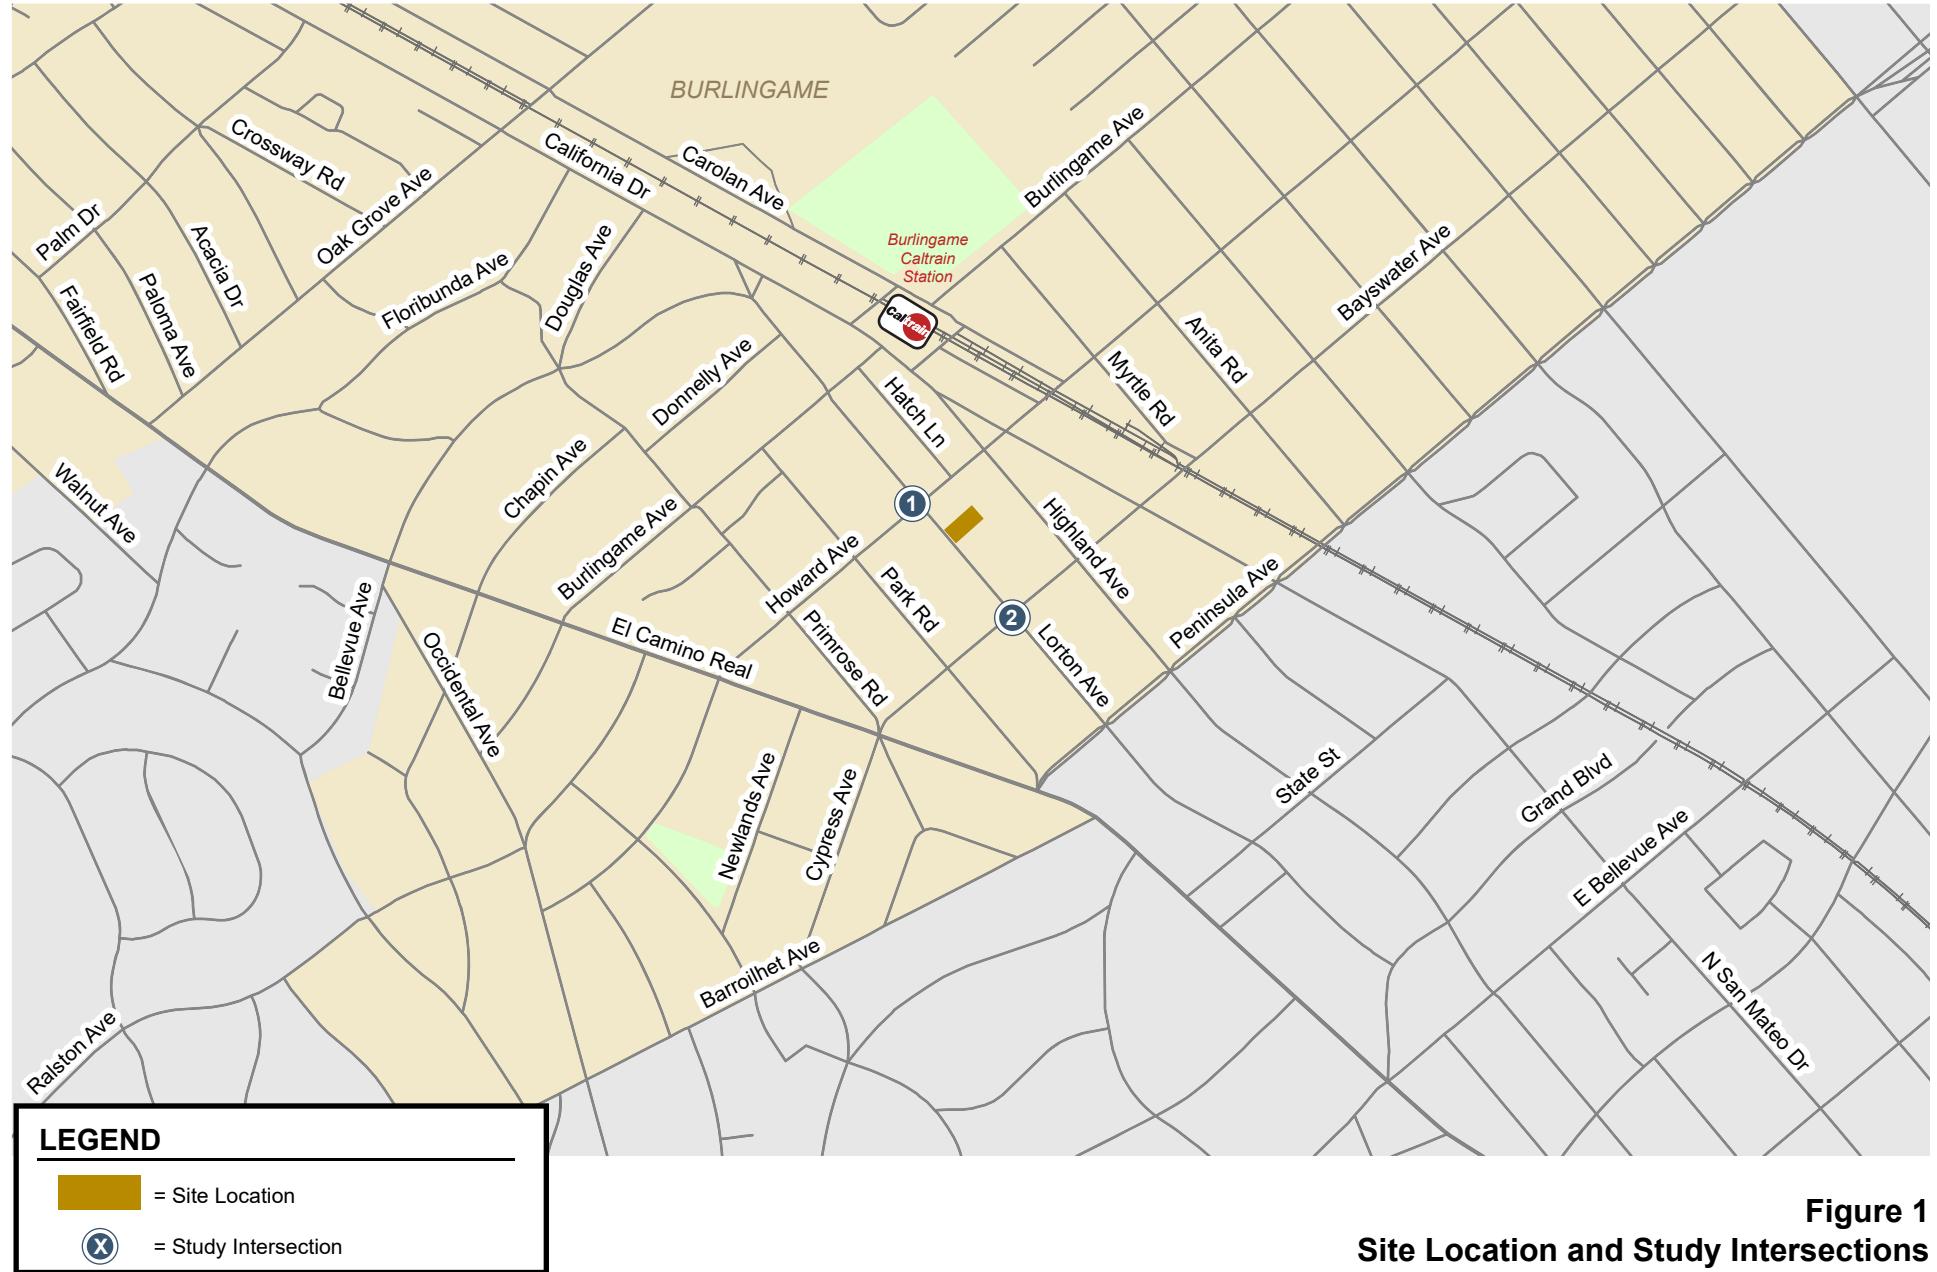

Figure 1
Site Location and Study Intersections

LORTON AVE

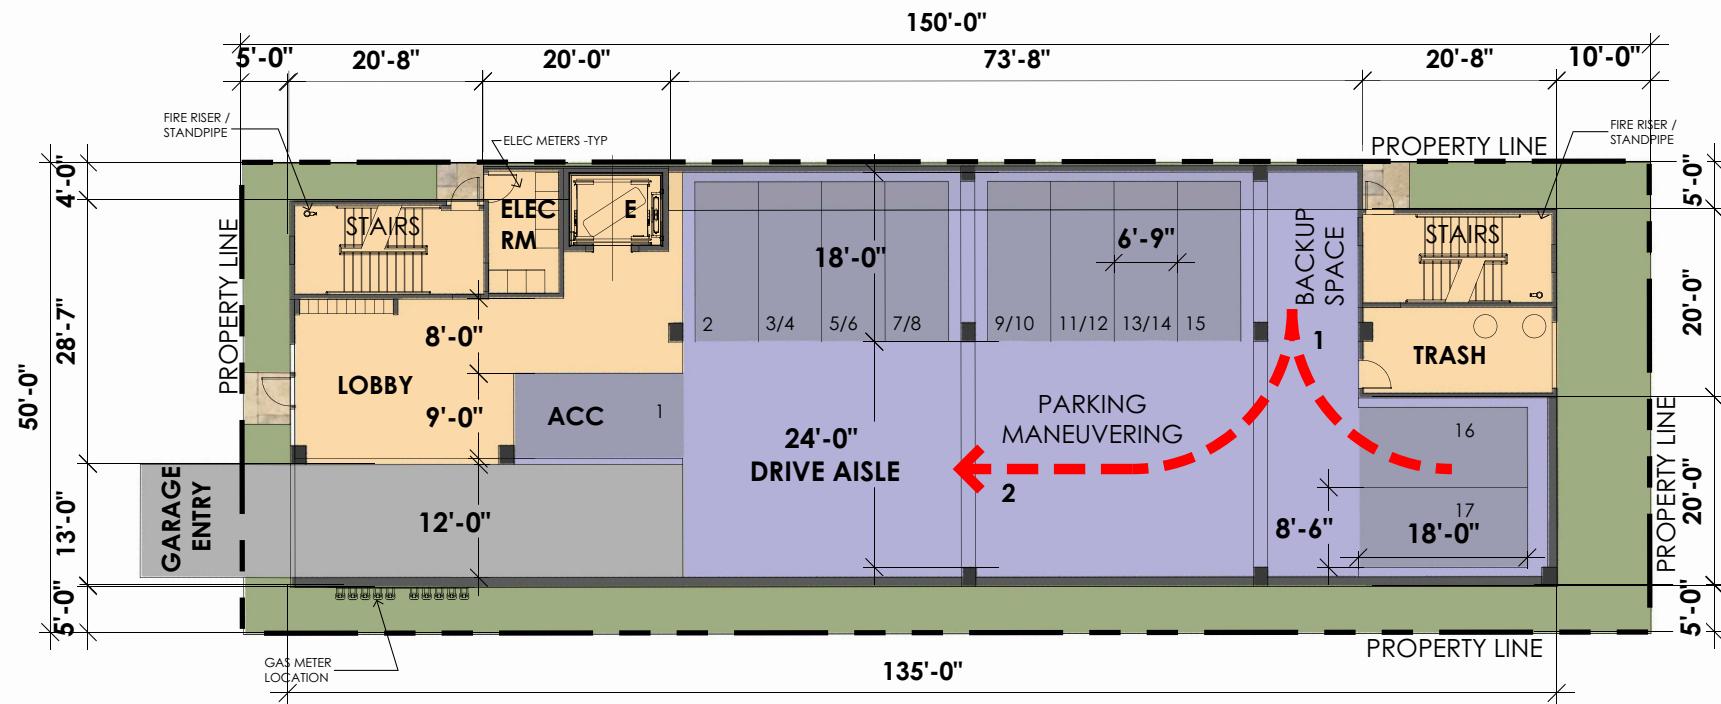

Figure 2
Project Site Plan

Traffic conditions at the study intersections were analyzed for both the weekday AM and PM peak hours of adjacent street traffic. The AM peak hour typically occurs between 7:00 AM and 9:00 AM and the PM peak hour typically occurs between 4:00 PM and 6:00 PM on a regular weekday. These are the peak commute hours during which most traffic congestion occurs on the roadways in the study area.

Traffic conditions were evaluated for the following scenarios:

Scenario 1: *Existing Conditions.* Existing traffic volumes at the study intersections were obtained from traffic counts conducted in March 2018 and January 2019. The study intersections were evaluated with a level of service analysis using Synchro software in accordance with the *2010 Highway Capacity Manual* methodology.

Scenario 2: *Background Conditions.* Background traffic volumes reflect traffic added by projected volumes from approved but not yet completed developments in the project area. The approved project trips and/or approved project information were obtained from recent traffic studies in the City of Burlingame.

Scenario 3: *Existing plus Project Conditions.* Existing traffic volumes with the project were estimated by adding to existing traffic volumes the additional traffic generated by the project. Existing plus project conditions were evaluated relative to existing conditions in order to determine the effects the project would have on the existing roadway network.

Scenario 4: *Project Conditions.* Background traffic volumes with the project (hereafter called project traffic volumes) were estimated by adding to background traffic volumes the additional traffic generated by the project. Project Conditions were evaluated relative to background conditions to determine potential project impacts.

Scenario 5: *Cumulative Conditions.* Cumulative traffic volumes represent traffic growth through the year 2028. Cumulative traffic volumes were estimated by applying an annual growth factor of 1.0 percent to the existing volumes, then adding trips from approved developments, as well as project-generated traffic. Cumulative conditions were evaluated relative to cumulative no project conditions to determine potential project impacts.

Methodology

This section presents the methods used to determine the traffic conditions for each scenario described above. It includes descriptions of the data requirements, the analysis methodologies, and the applicable level of service standards.

Data Requirements

The data required for the analysis were obtained from new traffic counts, the City of Burlingame, local traffic studies and EIRs, and field observations. The following data were collected from these sources:

- existing peak-hour intersection turning-movement volumes
- lane configurations
- approved project trips

Level of Service Standards and Analysis Methodologies

Traffic conditions at the study intersections were evaluated using level of service (LOS). *Level of Service* is a qualitative description of operating conditions ranging from LOS A, or free-flow conditions

with little or no delay, to LOS F, or jammed conditions with excessive delays. The various analysis methods are described below.

City of Burlingame Unsignalized Intersections

Level of service analysis at unsignalized intersections is generally used to determine the need for modification in the type of intersection control (i.e., all-way stop or signalization). As part of the evaluation, traffic volumes, delays and traffic signal warrants are evaluated to determine if the existing intersection control is appropriate.

Level of service at unsignalized intersections was based on the 2010 HCM method using the Synchro software platform. This method is applicable for both side-street and all-way stop-controlled intersections. At side-street stop-controlled intersections (e.g., the Lorton Avenue/Bayswater Avenue intersection), the levels of service are reported for the worst stop-controlled approach delay. For all-way stop-controlled intersections (e.g., the Lorton Avenue/Howard Avenue intersection), a weighted average delay of the entire intersection is presented.

The City of Burlingame does not have a formally-adopted level of service standard for unsignalized intersections. The correlation between average control delay and LOS for unsignalized intersections is shown in Table 1.

Table 1
Unsignalized Intersection Level of Service Definitions Based on Delay

Level of Service	Description	Average Control Delay Per Vehicle (sec.)
A	Little or no traffic delay	Up to 10.0
B	Short traffic delays	10.1 to 15.0
C	Average traffic delays	15.1 to 25.0
D	Long traffic delays	25.1 to 35.0
E	Very long traffic delays	35.1 to 50.0
F	Extreme traffic delays	Greater than 80.0

Traffic Signal Warrant

The level of service calculations at the unsignalized intersections is supplemented with an assessment of the need for installation of a traffic signal, known as a signal warrant analysis. The need for signalization of unsignalized intersections in an urban or suburban context is typically assessed based on the Peak Hour Volume Warrant (Warrant 3) described in the *California Manual on Uniform Traffic Control Devices for Streets and Highways* (CA MUTCD), Part 4, Highway Traffic Signals. This method makes no evaluation of intersection level of service, but simply provides an indication whether vehicular peak hour volumes are, or would be, sufficiently high to justify installation of a traffic signal.

The decision to install a traffic signal should not be based purely on the warrants alone. Instead, the decision should be considered when one or more of the warrants are met, which triggers further feasibility analysis. Engineering judgment should be exercised to determine how a traffic signal could affect collision rates and traffic conditions at the subject intersection, as well as at adjacent intersections. Other options besides a traffic signal should also be considered, such as all-way stop control, new or enhanced signage, or roadway geometry changes; these measures may be more appropriate than a new traffic signal.

CMP Roadway Impact and Compliance

As the Congestion Management Agency (CMA) for San Mateo County, the City/County Association of Governments (C/CAG) is responsible for maintaining the performance and standards of the Congestion Management Program (CMP) roadway network. Per CMP technical guidelines, all new developments estimated to add at least 100 net peak hour trips to the CMP roadway network are required to implement Travel Demand Management (TDM) measures in accordance with the C/CAG CMP checklist. Given that the proposed project is expected to add fewer than 100 net peak hour vehicle trips to the CMP roadway network, implementation of TDM measures is not required.

Report Organization

The remainder of this report is divided into six chapters. Chapter 2 describes the existing roadway network, transit services, and pedestrian facilities. Chapter 3 presents the intersection operations under background conditions and describes the approved projects in the City of Burlingame that would likely add traffic to the study area. Chapter 4 describes the methods used to estimate project-generated traffic and its impact on the transportation system. Chapter 5 describes cumulative traffic conditions, both without and with the project. Chapter 6 presents the analysis of other transportation related issues including transit, bicycle, and pedestrian facilities.

2. Existing Conditions

This chapter describes the existing conditions for transportation facilities in the vicinity of the site, including the roadway network, transit service, pedestrian and bicycle facilities, and the existing levels of service for the key intersections in the study area.

Existing Roadway Network

Regional access to the project site is provided via US 101 and El Camino Real (SR 82). Local access to the site is provided by Broadway, Peninsula Avenue, California Drive, Howard Avenue, Bayswater Avenue and Lorton Avenue. These roadways are described below.

US 101 is a north/south, eight-lane freeway in the vicinity of the site. US 101 extends northward through San Francisco and southward through San Jose. Access to and from the project study area is provided via a full interchange at Broadway and a partial interchange at Peninsula Avenue.

El Camino Real (SR 82) is a four-lane roadway west of the project site that serves as a north-south route of travel along the Peninsula in the vicinity of the site. El Camino Real extends northward to San Francisco, and southward to San Jose. The speed limit on El Camino Real is 35 MPH. There are sidewalks on both sides of the road in the project vicinity. Access to the project site from El Camino Real is provided via Howard Avenue and Bayswater Avenue.

Broadway is an east/west, two- to four-lane arterial that extends from west of Vancouver Avenue to Old Bayshore Highway, where it transitions into Airport Boulevard. Broadway operates north of the project site, and as one of the main gateways into the city with high volumes and access to other parts to the city. On-street parking and sidewalks are present on both the sides of the road in the project vicinity. Bike lanes available on Broadway east of Carolan Avenue. The posted speed limit on Broadway is 35 MPH. Access to the project site from Broadway is provided via California Drive and El Camino Real.

Peninsula Avenue is an east/west, two- to three-lane arterial that extends from El Camino Real east to Airport Boulevard, where it transitions into Coyote Point Drive. Peninsula Avenue operates south of the project site and acts as the southern gateway into the city, connecting the downtown Burlingame area with US 101 and El Camino Real. On-street parking and sidewalks are present on both sides of Peninsula Avenue, and the posted speed limit is 30 MPH. Access to the project site from Peninsula Avenue is provided via Lorton Avenue.

California Drive is a north/south roadway that extends from Millbrae Avenue in the City of Millbrae to Peninsula Avenue in San Mateo to the south, at which point it becomes North San Mateo Drive. California Drive consists of two lanes between Millbrae Avenue and Broadway, and four lanes south of

Broadway. In the project vicinity, on-street parking and sidewalks are present on both the sides of California Drive. The speed limit on California Drive is 30 MPH. California Drive is a designated Class III bike route north of South Lane. Access to the project site from California Drive is provided via Howard Avenue and Bayswater Avenue.

Howard Avenue is an east/west roadway with two or three lanes extending from Occidental Avenue in the west to N. Amphlett Boulevard in the east. The speed limit on Howard Avenue is 25 MPH. Four-hour metered parking is provided between 8 AM to 6 PM in the project vicinity. There are sidewalks on the both sides of the road. A Class III bike route on Howard Avenue extends from Occidental Avenue to East Lane, where it transitions into Class II bike lanes and extends east to Humboldt Street. Access to the project site from Howard Avenue is provided via Lorton Avenue.

Bayswater Avenue is an east/west roadway with two lanes extending from El Camino Real in the west to N. Amphlett Boulevard in the east. The speed limit on Bayswater Avenue is 25 MPH. There is two-hour on street parking between 8 AM to 6 PM. There is a sidewalk on both sides of the road. Access to the project site from Bayswater Avenue is provided via Lorton Avenue.

Lorton Avenue is a north/south roadway with two lanes extending from Bellevue Avenue in the north to Peninsula Avenue in the south, where it transitions into Prospect Row. The speed limit on Lorton Avenue is 25 MPH. Lorton Avenue has ten-hour metered parking along the project frontage and two-hour free parking along the west side between 8 AM and 6 PM. There are sidewalks on both sides of the road. Lorton Avenue provides direct access to the project site.

Existing Pedestrian and Bicycle Facilities

Pedestrian facilities consist of sidewalks, crosswalks, and pedestrian signals at signalized intersections. In the vicinity of the project site, sidewalks exist along both sides of Howard Avenue, Bayswater Avenue, Lorton Avenue, and Park Road, providing pedestrian access to and from the project site. Marked crosswalks are provided along all stop-controlled approaches except at the south leg of the Lorton Avenue/Bayswater Avenue intersection.

The overall network of sidewalks and crosswalks in the study area has adequate connectivity and provides pedestrians with safe routes to transit services and other points of interest in the vicinity of the project site.

Existing Bicycle Facilities

There are some bicycle facilities in the vicinity of the project site. The existing bicycle facilities within the study area are described below and are shown on Figure 3.

North-south bicycle connections in the study area include Class III bike routes along California Drive, Carolan Avenue, Primrose Road, and Highland Avenue. There are also Class II bike lanes north of the project site along Carolan Avenue.

East-west bicycle connections in the study area consist of bike routes along Oak Grove Avenue, Floribunda Avenue, Chapin Avenue, and Howard Avenue.

Although Lorton Avenue is not a designated bike route, due to low travel speed and traffic volume, it is conducive to bicycle travel.

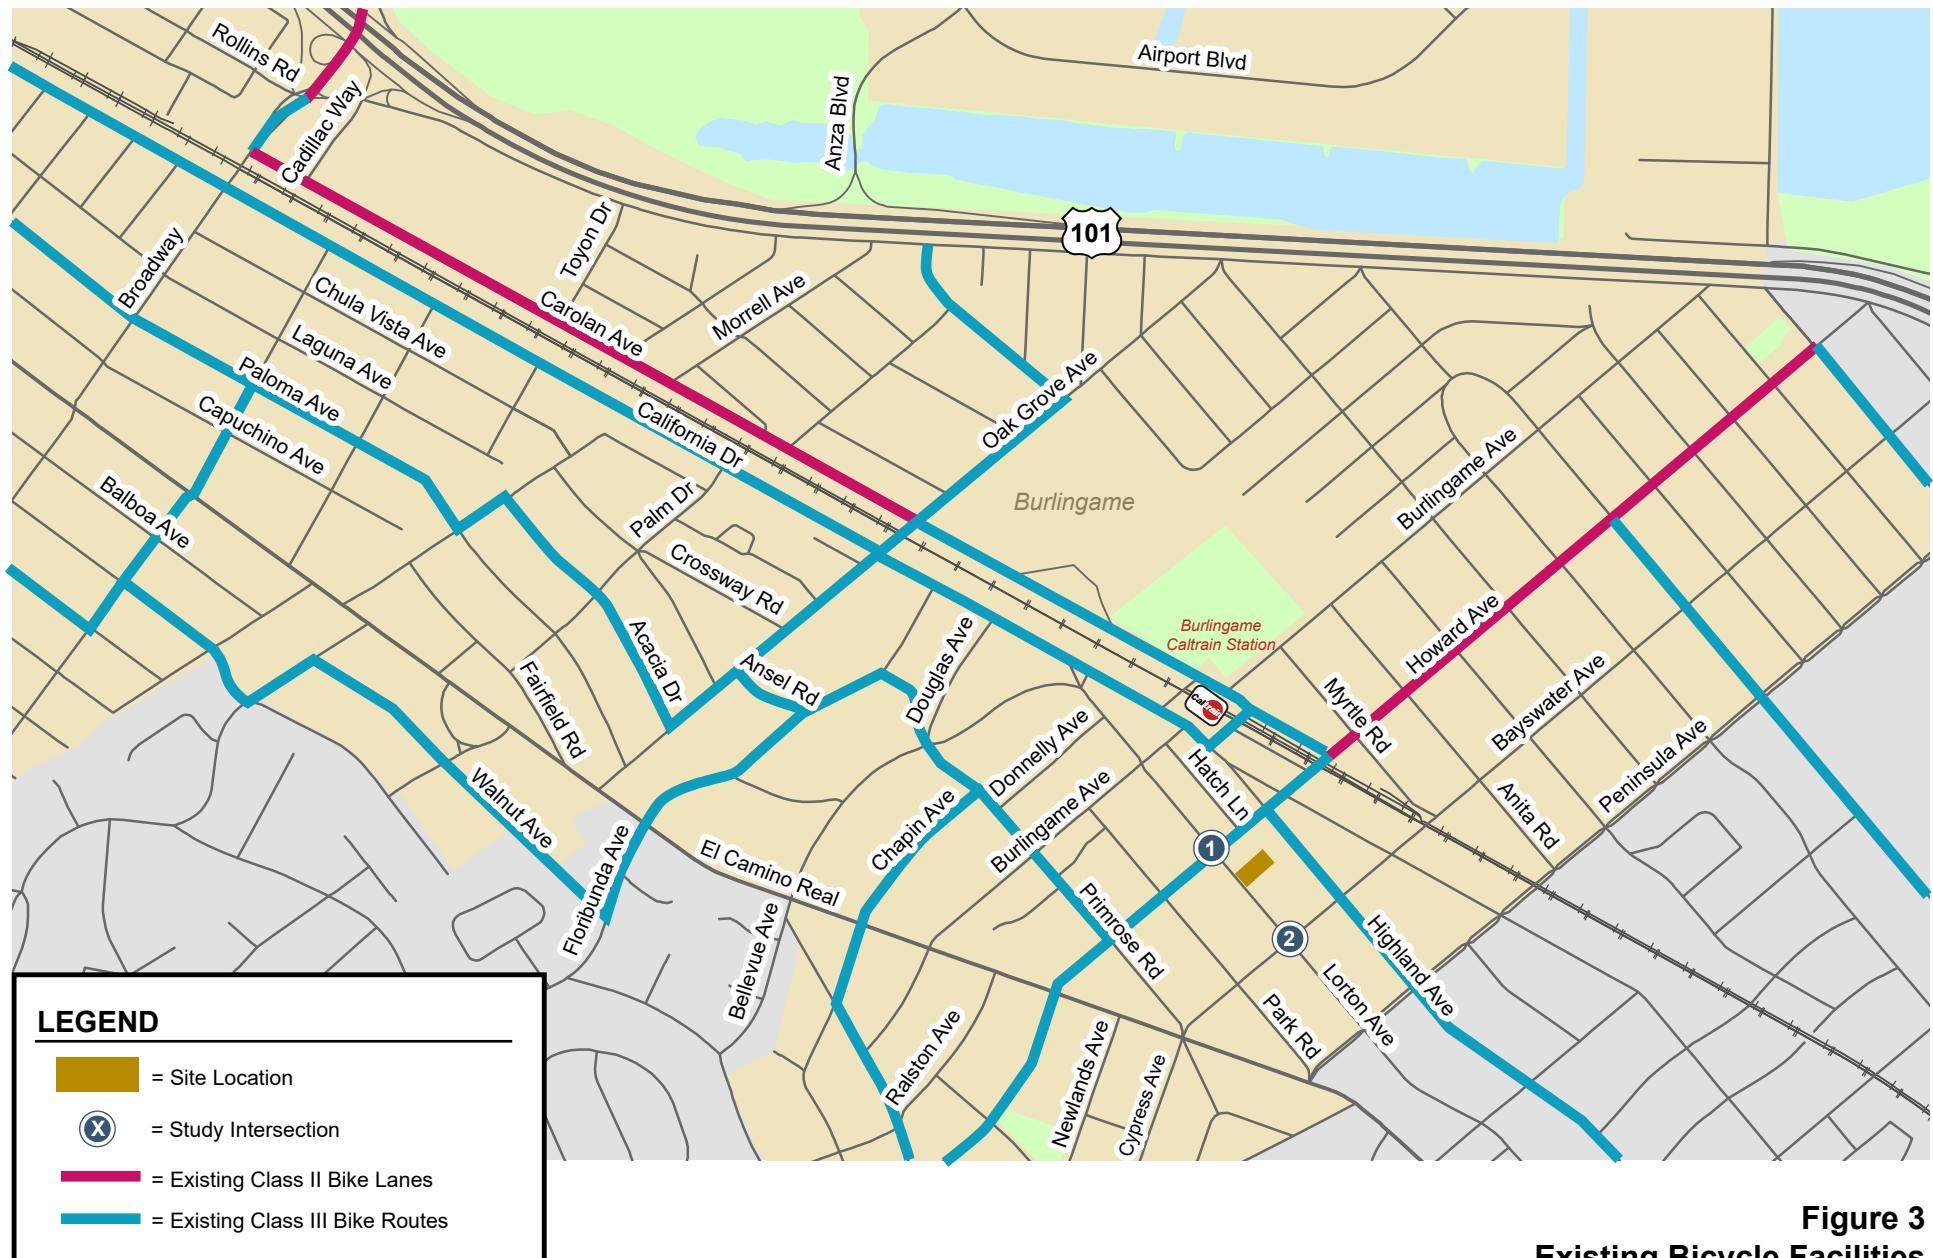

Figure 3
Existing Bicycle Facilities

Existing Transit Service

Existing transit service to the study area is provided by the San Mateo County Transit District (SamTrans), the City of Burlingame, and Caltrain (See Figure 4). The study area is served directly by express bus route and shuttle routes. The transit service routes that run through the study area are listed in Table 2, including their route description and commute hour headways. The nearest bus stops are located at the intersections along Howard Avenue at California Drive and El Camino Real. The Howard Avenue and California Drive bus stop is located approximately 900 feet walking distance from the project site, and the Howard Avenue and El Camino Real bus stop is 1,500 feet walking distance from the project site.

Table 2
Existing Transit Services

Transit Route	Route Description	Headway ¹
Operated by SamTrans		
Express Route 292	Hillsdale Shopping Center to Transbay Transit Center	20 to 30 mins
Express Route 397	Downtown San Francisco to Palo Alto Transit Center (provides limited overnight service)	60 mins ²
Multi-City Route ECR	Daly City BART Station to Palo Alto Transit Center	8 - 20 mins
Route ECR Rapid	Daly City BART Station to Redwood City Transit Center (provides service between 6 a.m. to 9 a.m. and 3.30 p.m. to 8 p.m.)	20 mins
Route 46	Burlingame Intermediate School to Burlingame Caltrain Station (schoolday service only)	
Operated by the City of Burlingame		
Burlingame Trolley Service	Burlingame Caltrain Station to San Francisco Airport Marriott Hotel	45 mins
Notes:		
¹ Approximate headways during peak commute periods.		

Caltrain Service

Caltrain provides frequent passenger train service between San Jose and San Francisco seven days a week. During commute hours, Caltrain provides extended service to Morgan Hill and Gilroy. The closest Caltrain station is the Burlingame Station (approximately a quarter mile north of the project site), providing weekday and weekend service. The Burlingame Station provides local and limited Caltrain service. Trains that stop at the Burlingame Station operate at approximately 20 to 40-minute headways in both directions during the commute hours, with somewhat less frequent service midday. Service operates between about 5:30 AM and 11:35 PM in the northbound direction and between 5:20 AM and 12:35 AM (next day) in the southbound direction.

As part of the Caltrain Modernization Program, the rail service will be electrified. The electrified Caltrain system will provide increased service and is also expected to help accommodate the increase in system ridership through much improved system operations.

Existing Intersection Lane Configurations and Traffic Volumes

The existing lane configurations at the study intersections were determined by observations in the field and are shown on Figure 5. Existing traffic volumes were obtained from peak hour counts collected on March 28th of 2018 and January 10th of 2019. The existing peak-hour intersection volumes are shown on Figure 6. Intersection turning-movement counts conducted for this analysis are presented in Appendix A.

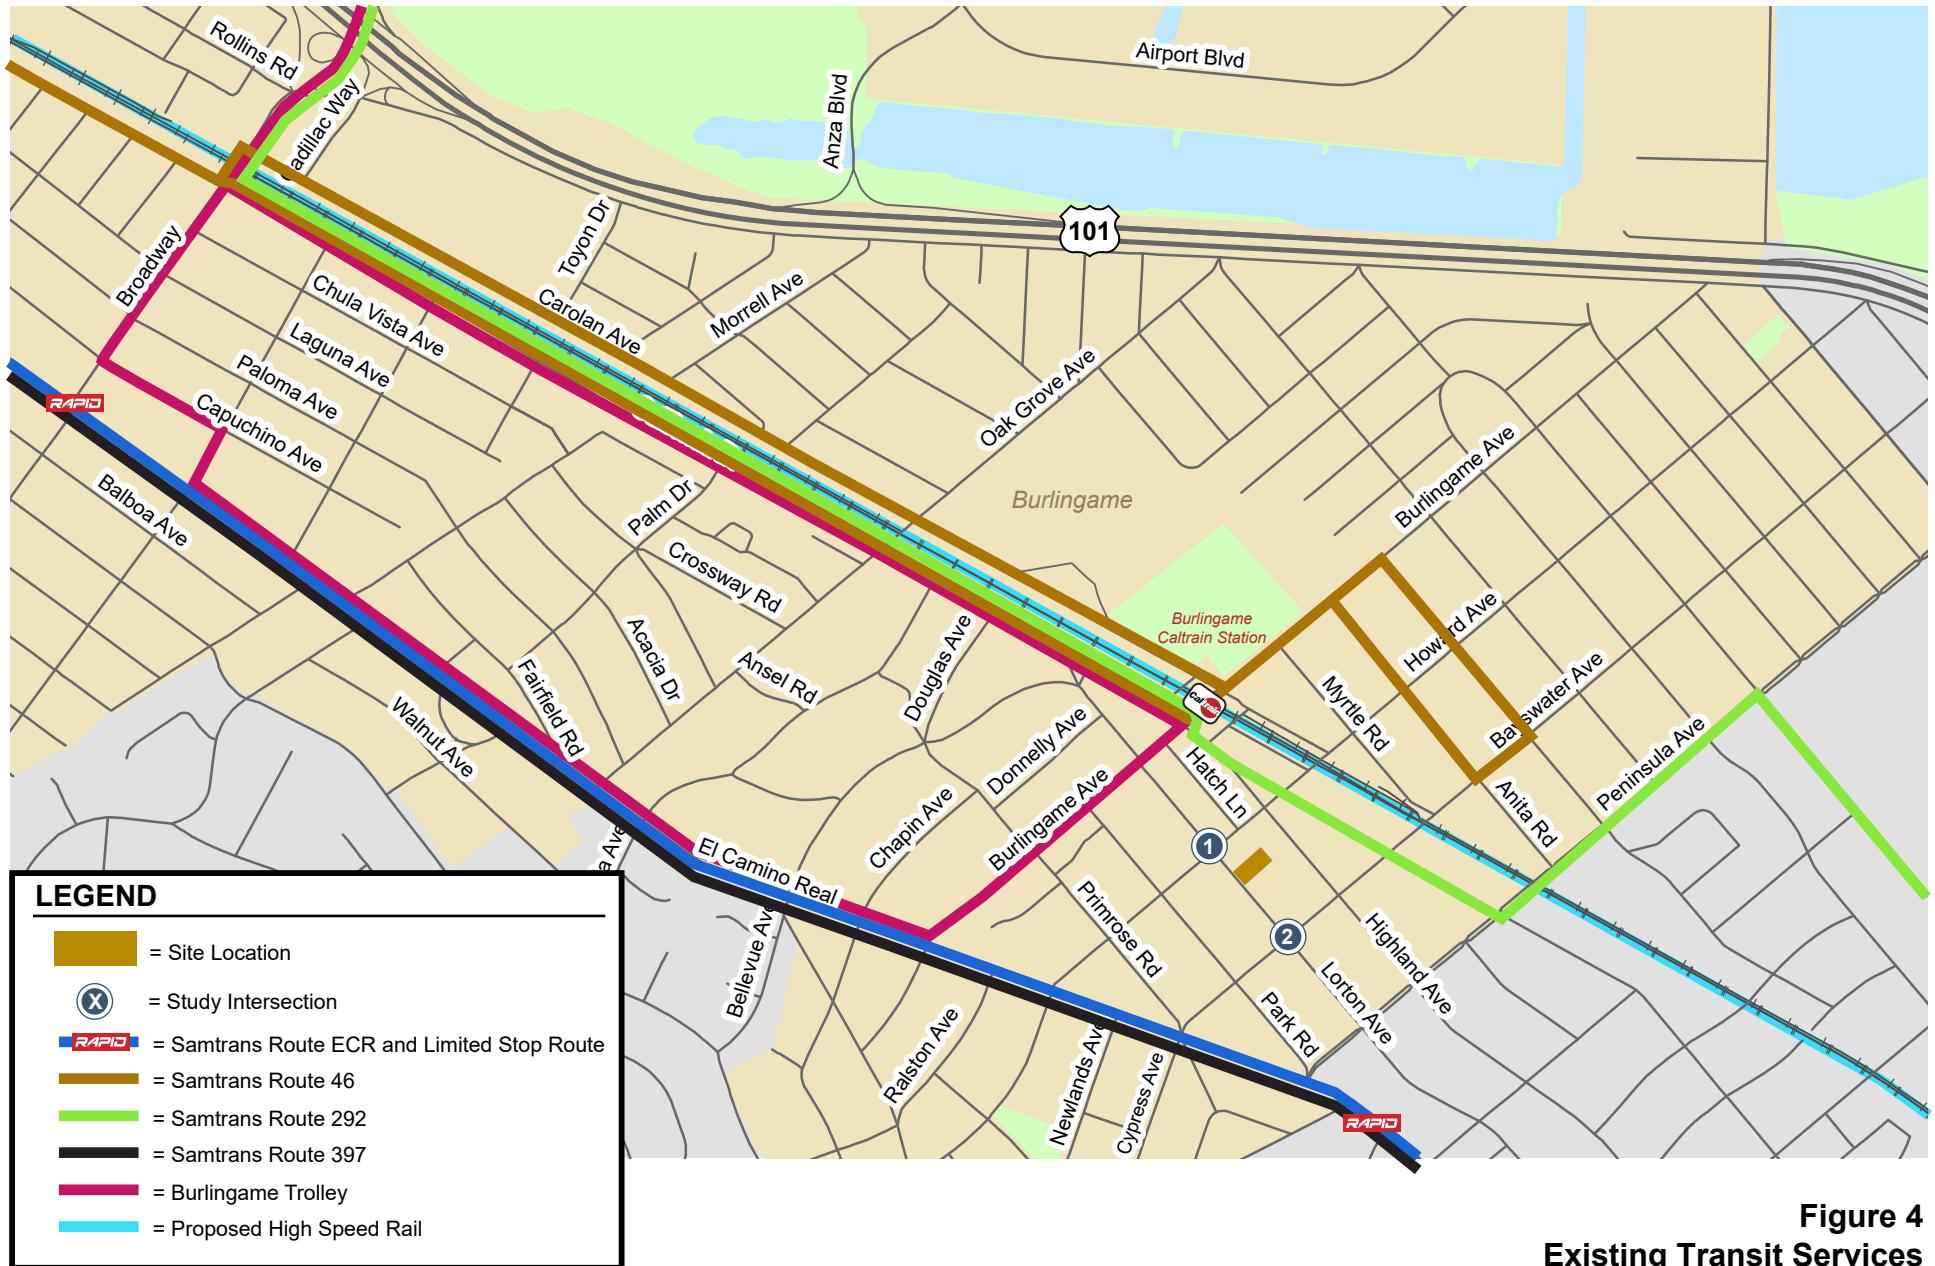

Figure 4
Existing Transit Services

128 Lorton Avenue at Burlingame Transportation Impact Analysis

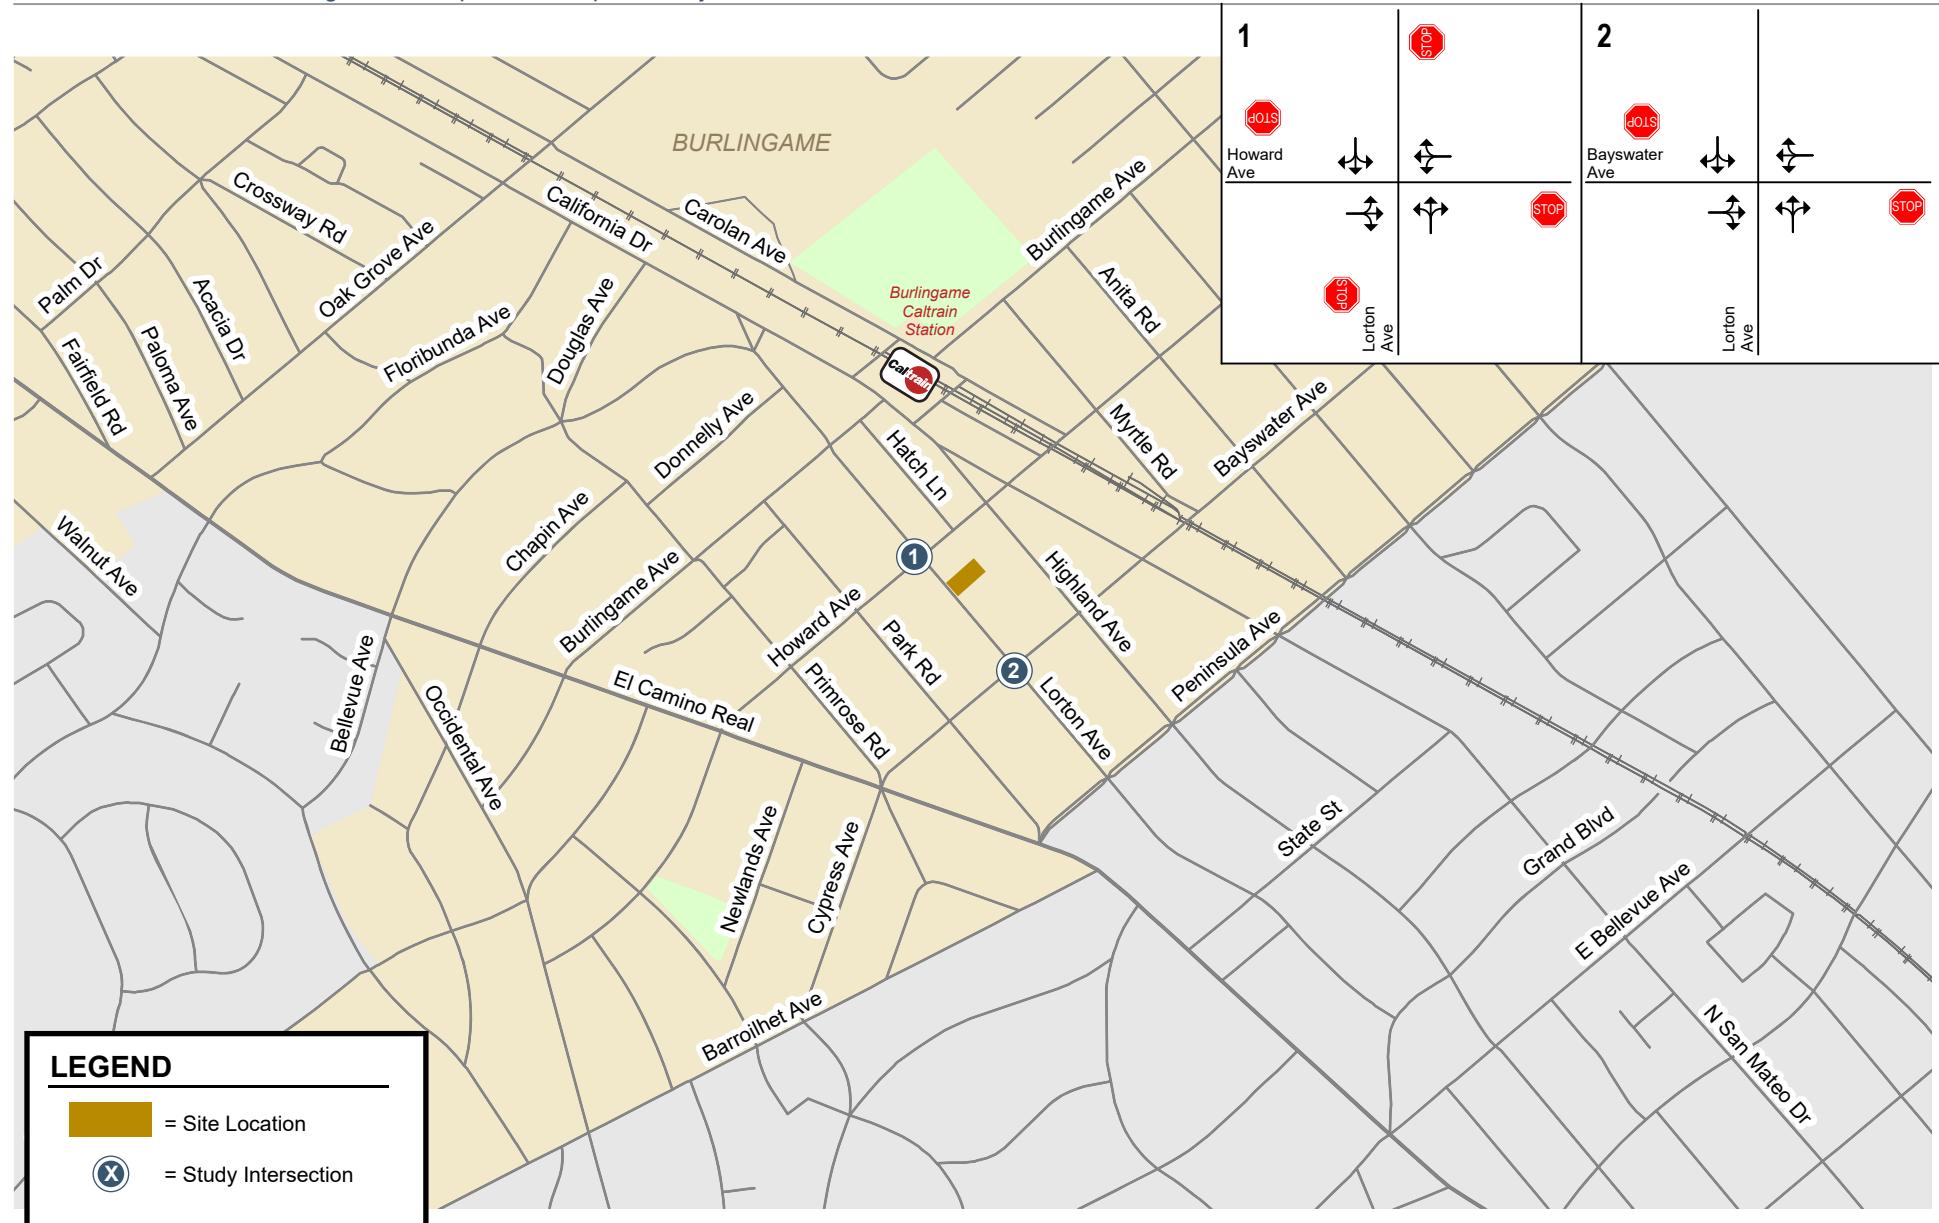

Figure 5
Existing Intersection Lane Configurations

128 Lorton Avenue at Burlingame Transportation Impact Analysis

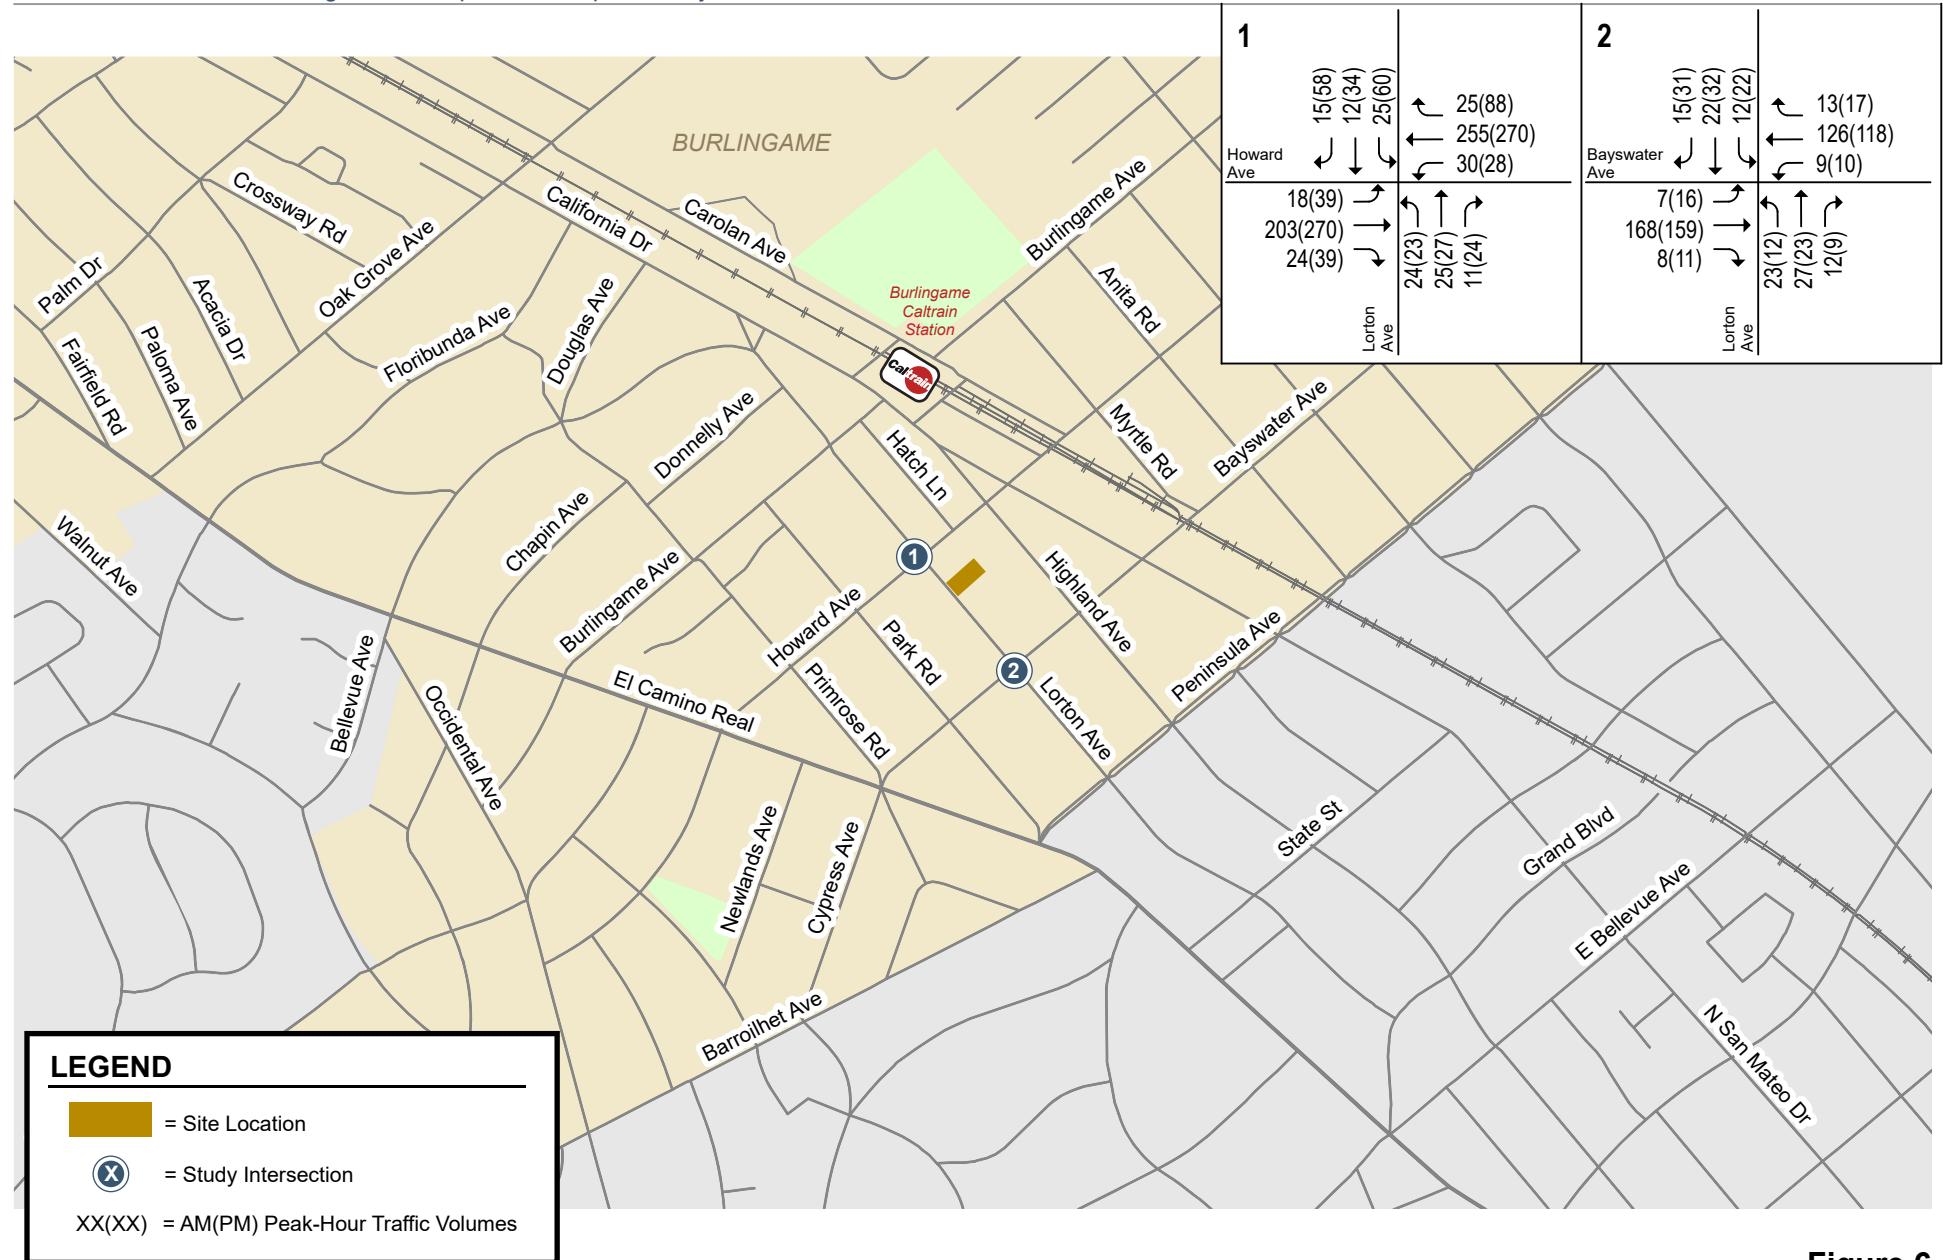

Figure 6
Existing Traffic Volumes

Existing Intersection Levels of Service

The results of the analysis show that both the unsignalized study intersections currently operate at LOS A or LOS B during the AM and PM peak hours (see Table 3). This indicates that vehicles at the stop-controlled approaches experience only minor delays.

The intersection level of service calculation sheets are included in Appendix C. A tabular summary of existing traffic volumes at each study intersection is contained in Appendix E.

Table 3
Existing Intersection Levels of Service

Study Number	Intersection	Count Date	Traffic Control	Peak Hour	Existing Conditions	
					Avg. Delay (sec.)	LOS
1	Lorton Avenue and Howard Avenue	01/10/19	AWSC ¹	AM	9.8	A
		01/10/19		PM	12.6	B
2	Lorton Avenue and Bayswater Avenue	03/28/18	TWSC ²	AM	11.6	B
		03/28/18		PM	11.5	B

Notes:

AWSC = All-Way Stop Control
 TWSC = Two-Way Stop Control
¹ Average delay for an all-way stop controlled intersection is reported for the entire intersection.
² Average delay for a two-way stop controlled intersection is reported for the worst stop-controlled approach.

Observed Existing Traffic Conditions

Traffic conditions in the field were observed to identify existing operational deficiencies and to confirm the accuracy of calculated intersection levels of service. The purpose of this effort was (1) to identify any existing traffic problems that may not be directly related to level of service, and (2) to identify any locations where the level of service analysis does not accurately reflect existing traffic conditions. The study intersections nearest to the project site operate adequately during the AM and PM peak hours of traffic, and the level of service analysis accurately reflects existing traffic conditions observed in the field.

3. Background Conditions

This chapter describes background traffic conditions. Background conditions are defined as conditions within the next 3-5 years (a horizon year of 2021-2023) just prior to completion/occupancy of the proposed development. Traffic volumes for background conditions comprise existing traffic volumes plus traffic generated by other approved developments in the vicinity of the site. This chapter describes the procedure used to determine background traffic volumes and the resulting traffic conditions.

Roadway Network and Traffic Volumes

It is assumed in this analysis that the transportation network under background conditions, including roadways and intersection lane configurations, would be the same as that described under existing conditions at all study intersections

Background traffic volumes for the study intersections were estimated by adding to existing traffic volumes the trips generated by nearby approved but not yet completed or occupied projects in the area. A list of approved developments was obtained from the City of Burlingame. Trip generation estimates for the approved projects were based on their respective traffic study, if available. For small projects that did not require a traffic study, trips were estimated based on ITE trip rates. The estimated trips from the approved projects were distributed and assigned throughout the study area based on the trip distribution assumptions present in the traffic studies or based on knowledge of travel patterns in the study area. The approved background project trips are shown on Figure 7. Background peak hour traffic volumes are shown on Figure 8. The approved developments list from the City is included in Appendix B.

Background Intersection Levels of Service

Table 4 shows that both of the study intersections would continue to operate at acceptable levels of service (LOS B or better) during both the AM and PM peak hours under background conditions. This indicates that, under background conditions, vehicles at the stop-controlled approaches would continue to experience only minor delays.

The intersection level of service calculation sheets are provided in Appendix C. A tabular summary of approved trips and background traffic volumes at each study intersection is contained in Appendix E.

128 Lorton Avenue at Burlingame Transportation Impact Analysis

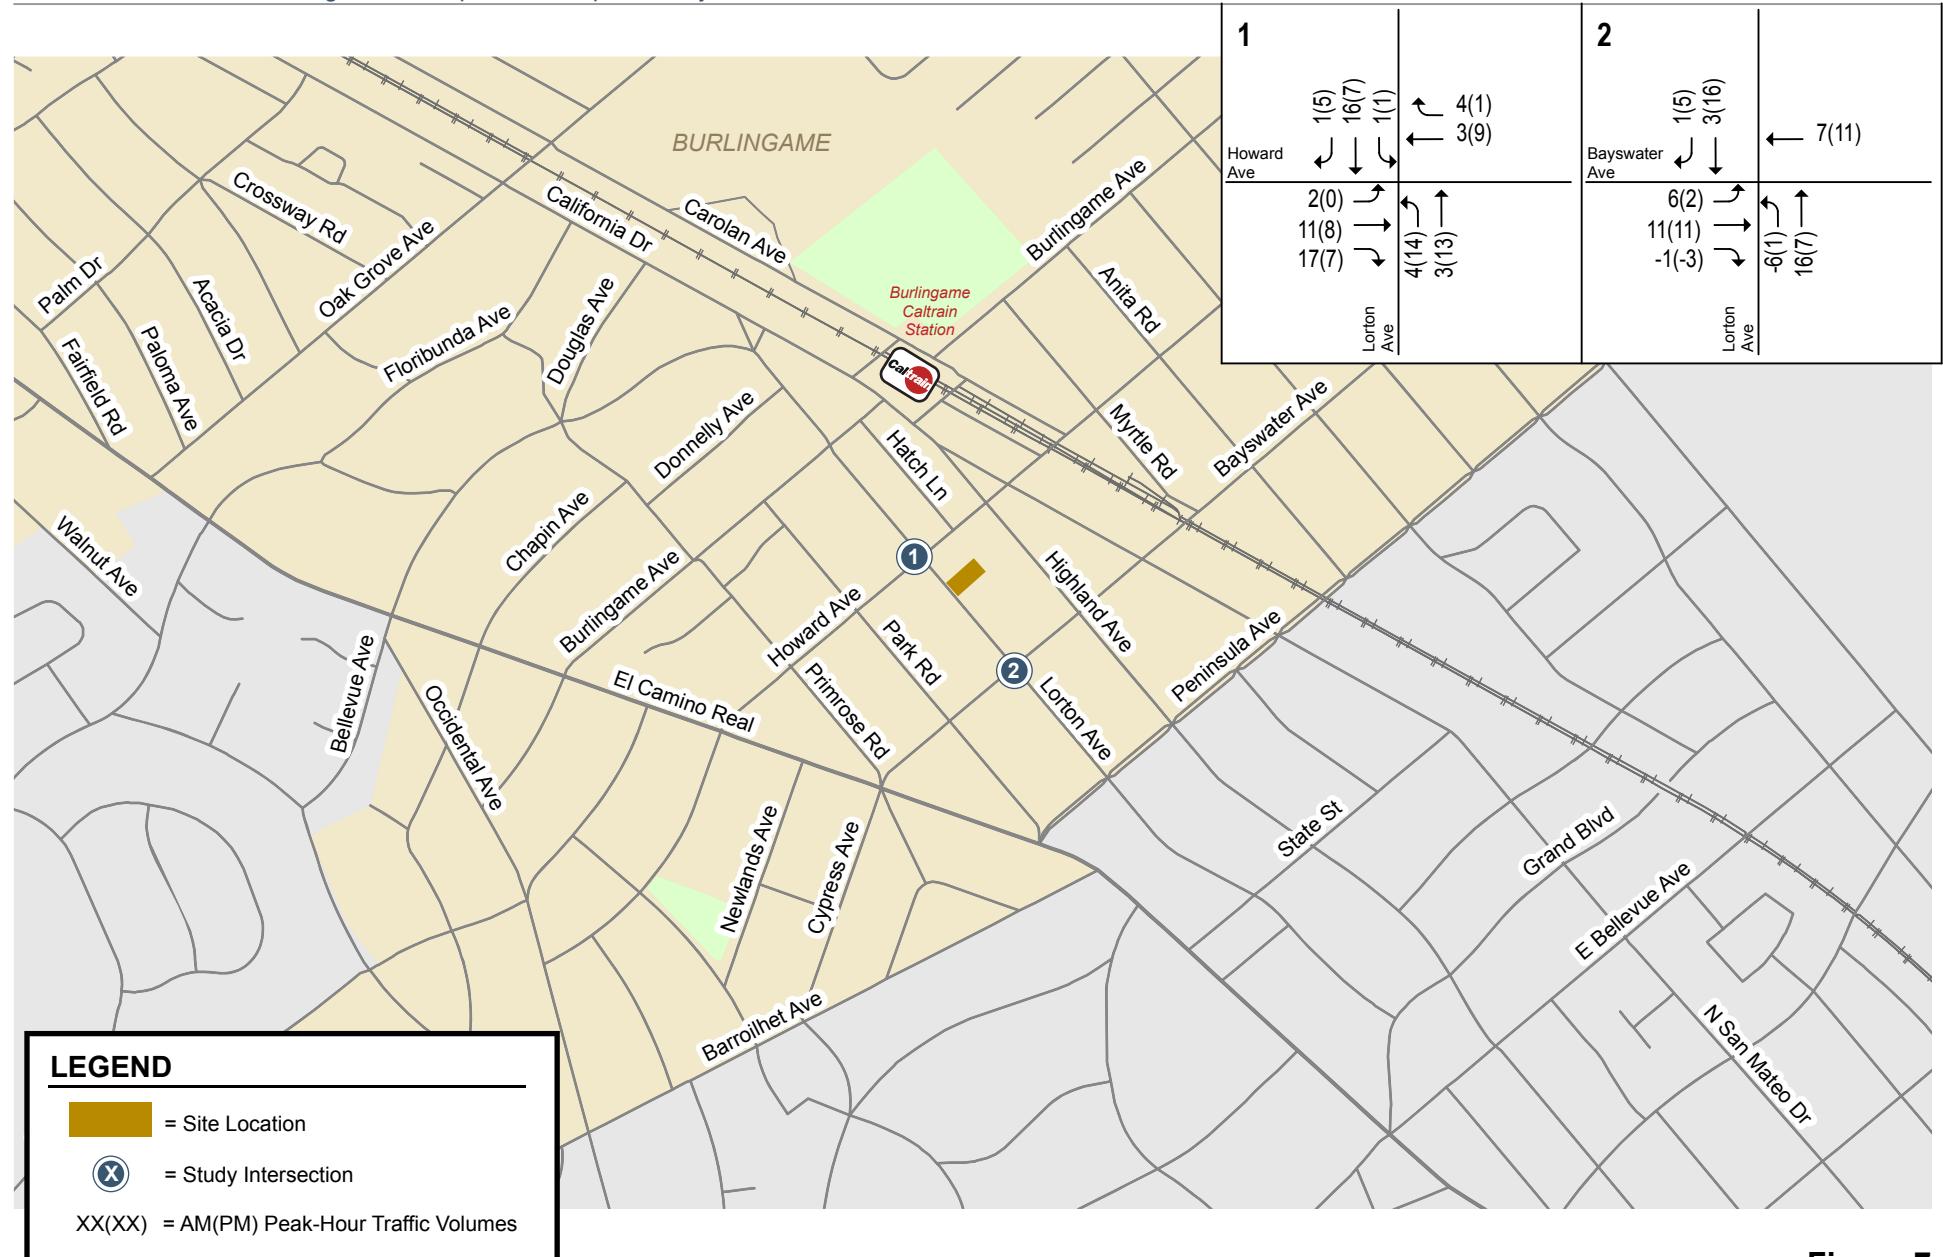

Figure 7
Approved Background Project Trips

128 Lorton Avenue at Burlingame Transportation Impact Analysis

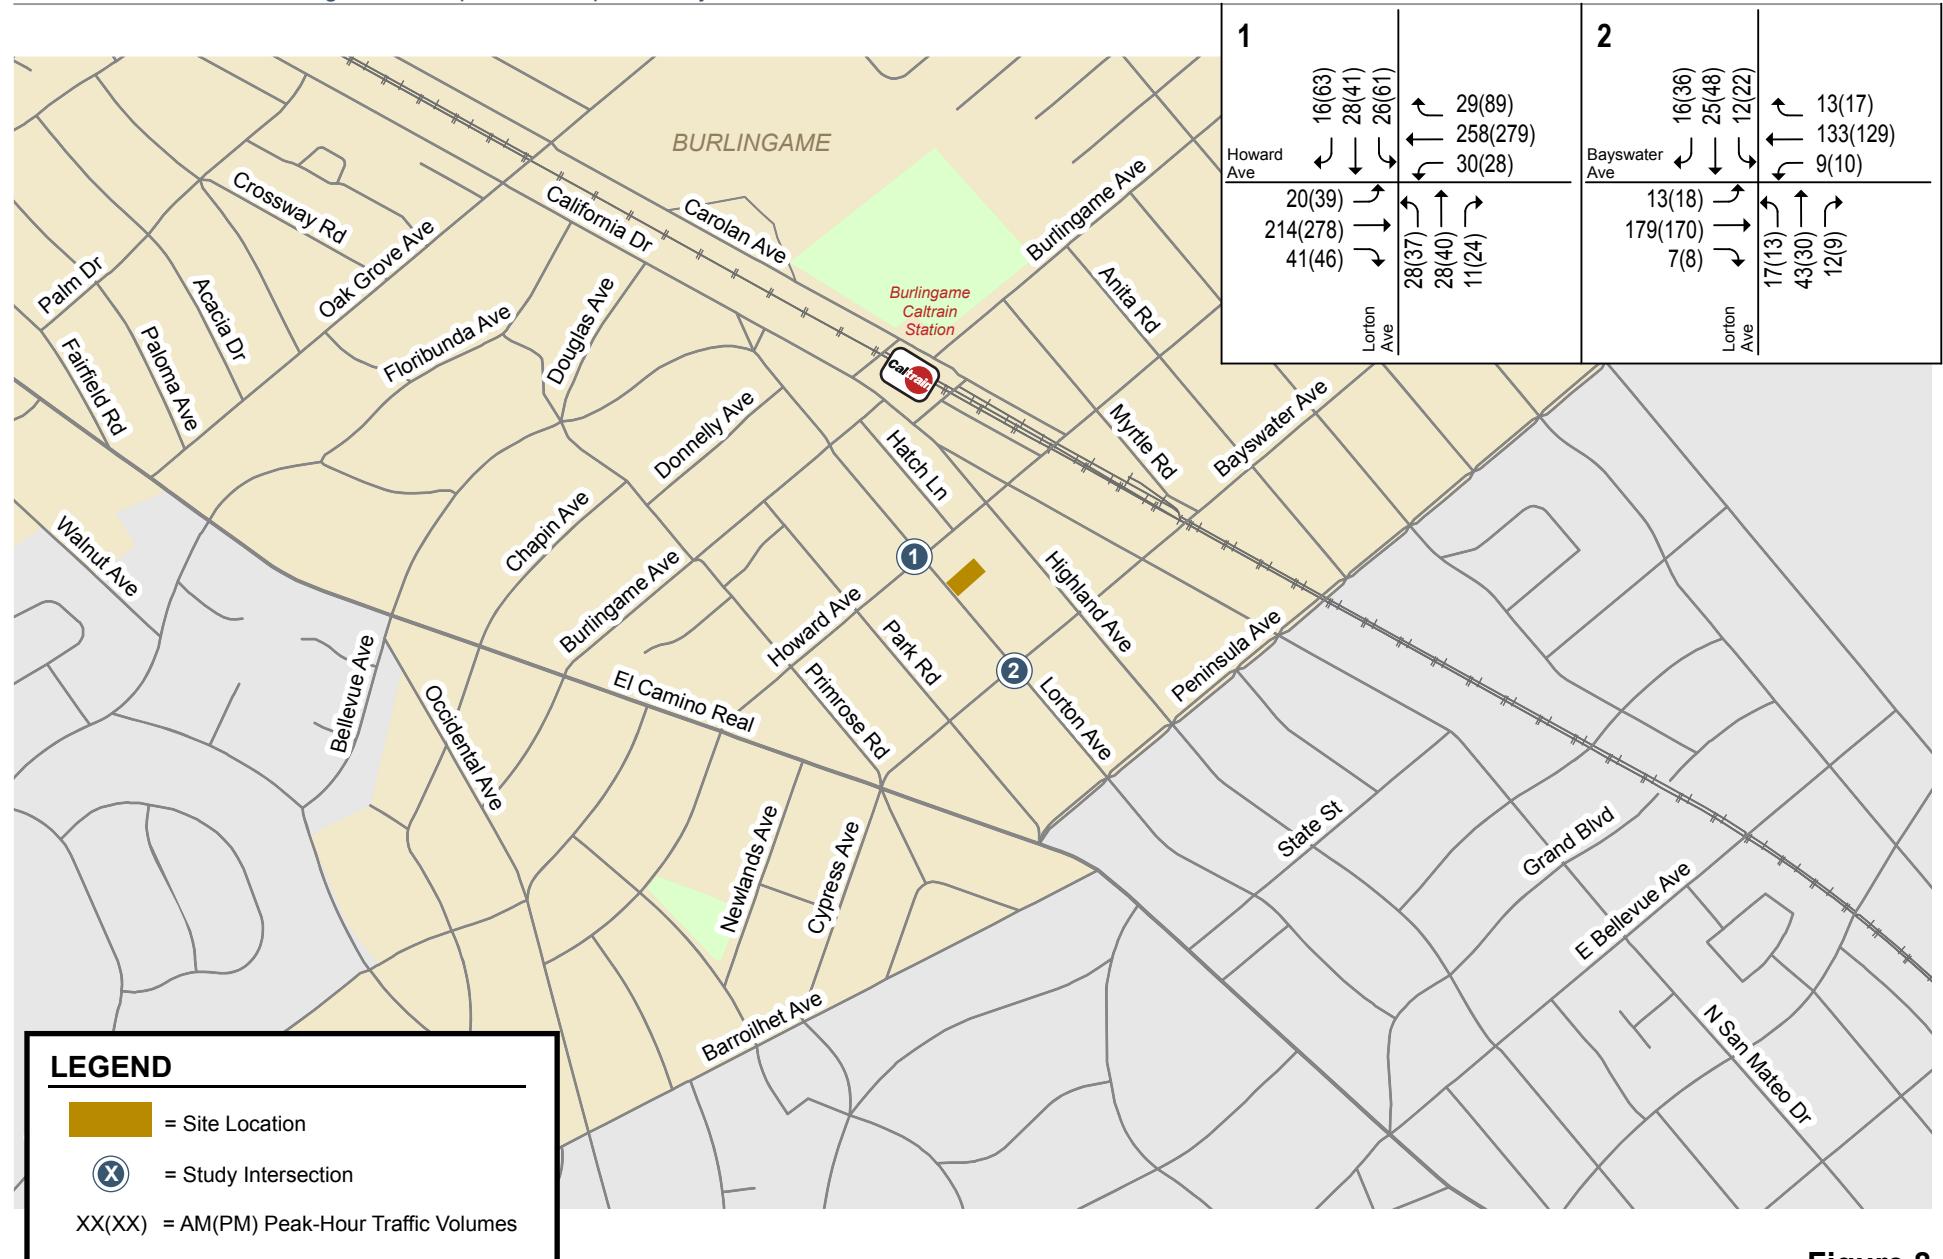

Figure 8
Background Traffic Volumes

Table 4
Background Intersection Levels of Service

Study Number	Intersection	Traffic Control	Peak Hour	Existing		Background	
				Avg. Delay (sec.)	LOS	Avg. Delay (sec.)	LOS
1	Lorton Avenue and Howard Avenue	AWSC ¹	AM	9.8	A	10.2	B
			PM	12.6	B	13.6	B
2	Lorton Avenue and Bayswater Avenue	TWSC ²	AM	11.6	B	12.1	B
			PM	11.5	B	12.0	B

Notes:

AWSC = All-Way Stop Control
TWSC = Two-Way Stop Control
¹ Average delay for an all-way stop controlled intersection is reported for the entire intersection.
² Average delay for a two-way stop controlled intersection is reported for the worst stop-controlled approach.

4. Project Conditions

This chapter describes traffic conditions with the project and includes: (1) the method by which project traffic is estimated and (2) a level of service summary. Existing plus project conditions are represented by existing traffic conditions with the addition of traffic generated by the project. Existing plus project traffic conditions could potentially occur if the project were to be occupied prior to the other approved projects in the area. Project conditions are represented by background traffic conditions with the addition of traffic generated by the project.

Roadway Network

It is assumed in this analysis that the transportation network under project conditions would be the same as the background transportation network.

Project Trip Estimates

The magnitude of traffic produced by a new development and the locations where that traffic would appear were estimated using a three-step process: (1) trip generation, (2) trip distribution, and (3) trip assignment. In determining project trip generation, the magnitude of traffic traveling to and from the proposed residential development was estimated for the AM and PM peak hours. As part of the project trip distribution, the directions to and from which the project trips would travel were estimated. In the project trip assignment, the project trips were assigned to specific streets and intersections. These procedures are described below.

Trip Generation

Through empirical research, data have been collected that quantify the amount of traffic expected to be produced by many types of land uses. The research is published by the Institute of Transportation Engineers (ITE) in *Trip Generation, 10th Edition* (2017). Project trip generation was estimated by applying to the size and uses of the development the appropriate trip generation rates obtained from the ITE Trip Generation Manual, 10th Edition. The average trip generation rates for Multi-Family Housing Mid-Rise (Land Use 221) was applied to the project. Mid-rise multifamily housing is defined as apartments located within the same building with at least three other dwelling units and that have between three and 10 levels (floors). Based on the size of the project, the proposed development would generate a total of 103 gross daily vehicle trips, with 7 gross trips occurring during the AM peak hour and 8 gross trips occurring during the PM peak hour (see Table 5).

Trips being generated by the existing four homes on the site can be subtracted from the project trip estimates. The rates published for Multi-Family Housing Low-Rise (Land Use 220) were used to estimate the trips that are being generated by the existing homes. Low-rise multifamily housing is defined as condominiums located within the same building with at least three other dwelling units and

that have one or two levels (floors). Based on the ITE trip generation rates, the homes are generating 2 outbound trips during the AM peak hour, and 2 inbound trips during the PM peak hour.

Trip Reductions

A transit trip reduction of 10 percent was applied to the peak hour trip generation estimates to both the existing and proposed project trips. The reduction is based on the project's proximity to the Burlingame Trolley service and the Burlingame Caltrain Station. The project site is located one quarter mile south of the Burlingame Caltrain Station, which also serves the Burlingame Trolley.

Net Project Trips

After applying the trip reductions, the project is estimated to generate 67 net new daily vehicle trips, with 4 net new trips (2 inbound and 2 outbound) during the AM peak hour and 5 net new trips (2 inbound and 3 outbound) during the PM peak hour (See Table 5).

Table 5
Project Trip Generation Estimates

Land Use	Size	Unit	Daily		AM Peak Hour				PM Peak Hour			
			Rate	Trips	Rate	In	Out	Total	Rate	In	Out	Total
Proposed Uses												
Multi-Family Housing ¹	19	DU	5.44	103	0.36	2	5	7	0.44	5	3	8

Existing Uses												
Low-Rise Housing ²	4	DU	7.32	29	0.46	0	2	2	0.56	2	0	2
<i>Proximity to Transit Trip Reduction (10%)³</i>				(3)		0	0	0		0	0	0
Subtotal				26		0	2	2		2	0	2
Total Project Trips				67		2	2	4		2	3	5
<i>Notes:</i>												
DU = Dwelling Units												
¹ Multifamily Housing (Mid-Rise) (Land Use 221) average rates published in ITE's <i>Trip Generation Manual, 10th Edition, 2017</i> .												
² Multifamily Housing (Low-Rise) (Land Use 220) average rates published in ITE's Trip Generation Manual, 10th Edition, 2017.												
³ A 10% trip reduction was applied given the project's proximity to the Burlingame Caltrain Station (within 1/4 mile).												

Trip Distribution and Trip Assignment

The trip distribution pattern for the project was estimated based on existing travel patterns on the surrounding roadway system and the locations of complementary land uses. The peak hour vehicle trips generated by the project were assigned to the roadway network in accordance with the trip distribution pattern.

Figure 9 show the trip distribution pattern and trip assignment for the proposed project.

Existing Plus Project Traffic Volumes

Project trips, as represented in the above project trip assignment, were added to existing traffic volumes to obtain existing plus project traffic volumes. The existing plus project traffic volumes are shown on Figure 10.

Existing Plus Project Intersection Analysis

The results of the analysis show that all the unsignalized study intersections currently operate at LOS A or LOS B during the AM and PM peak hours would continue to operate at LOS B or better during both peak hours (see Table 6). This indicates that, with the addition of project traffic under existing conditions, vehicles at the stop-controlled approaches are expected to continue to experience only minor delay.

The intersection level of service calculation sheets are provided in Appendix C. Traffic volumes for all components of traffic are tabulated in Appendix E.

Table 6
Existing Plus Project Intersection Levels of Service

TWSC = Two-Way Stop Control
¹ Average delay for an all-way stop controlled intersection is reported for the entire intersection.
² Average delay for a two-way stop controlled intersection is reported for the worst stop-controlled approach.

128 Lorton Avenue at Burlingame Transportation Impact Analysis

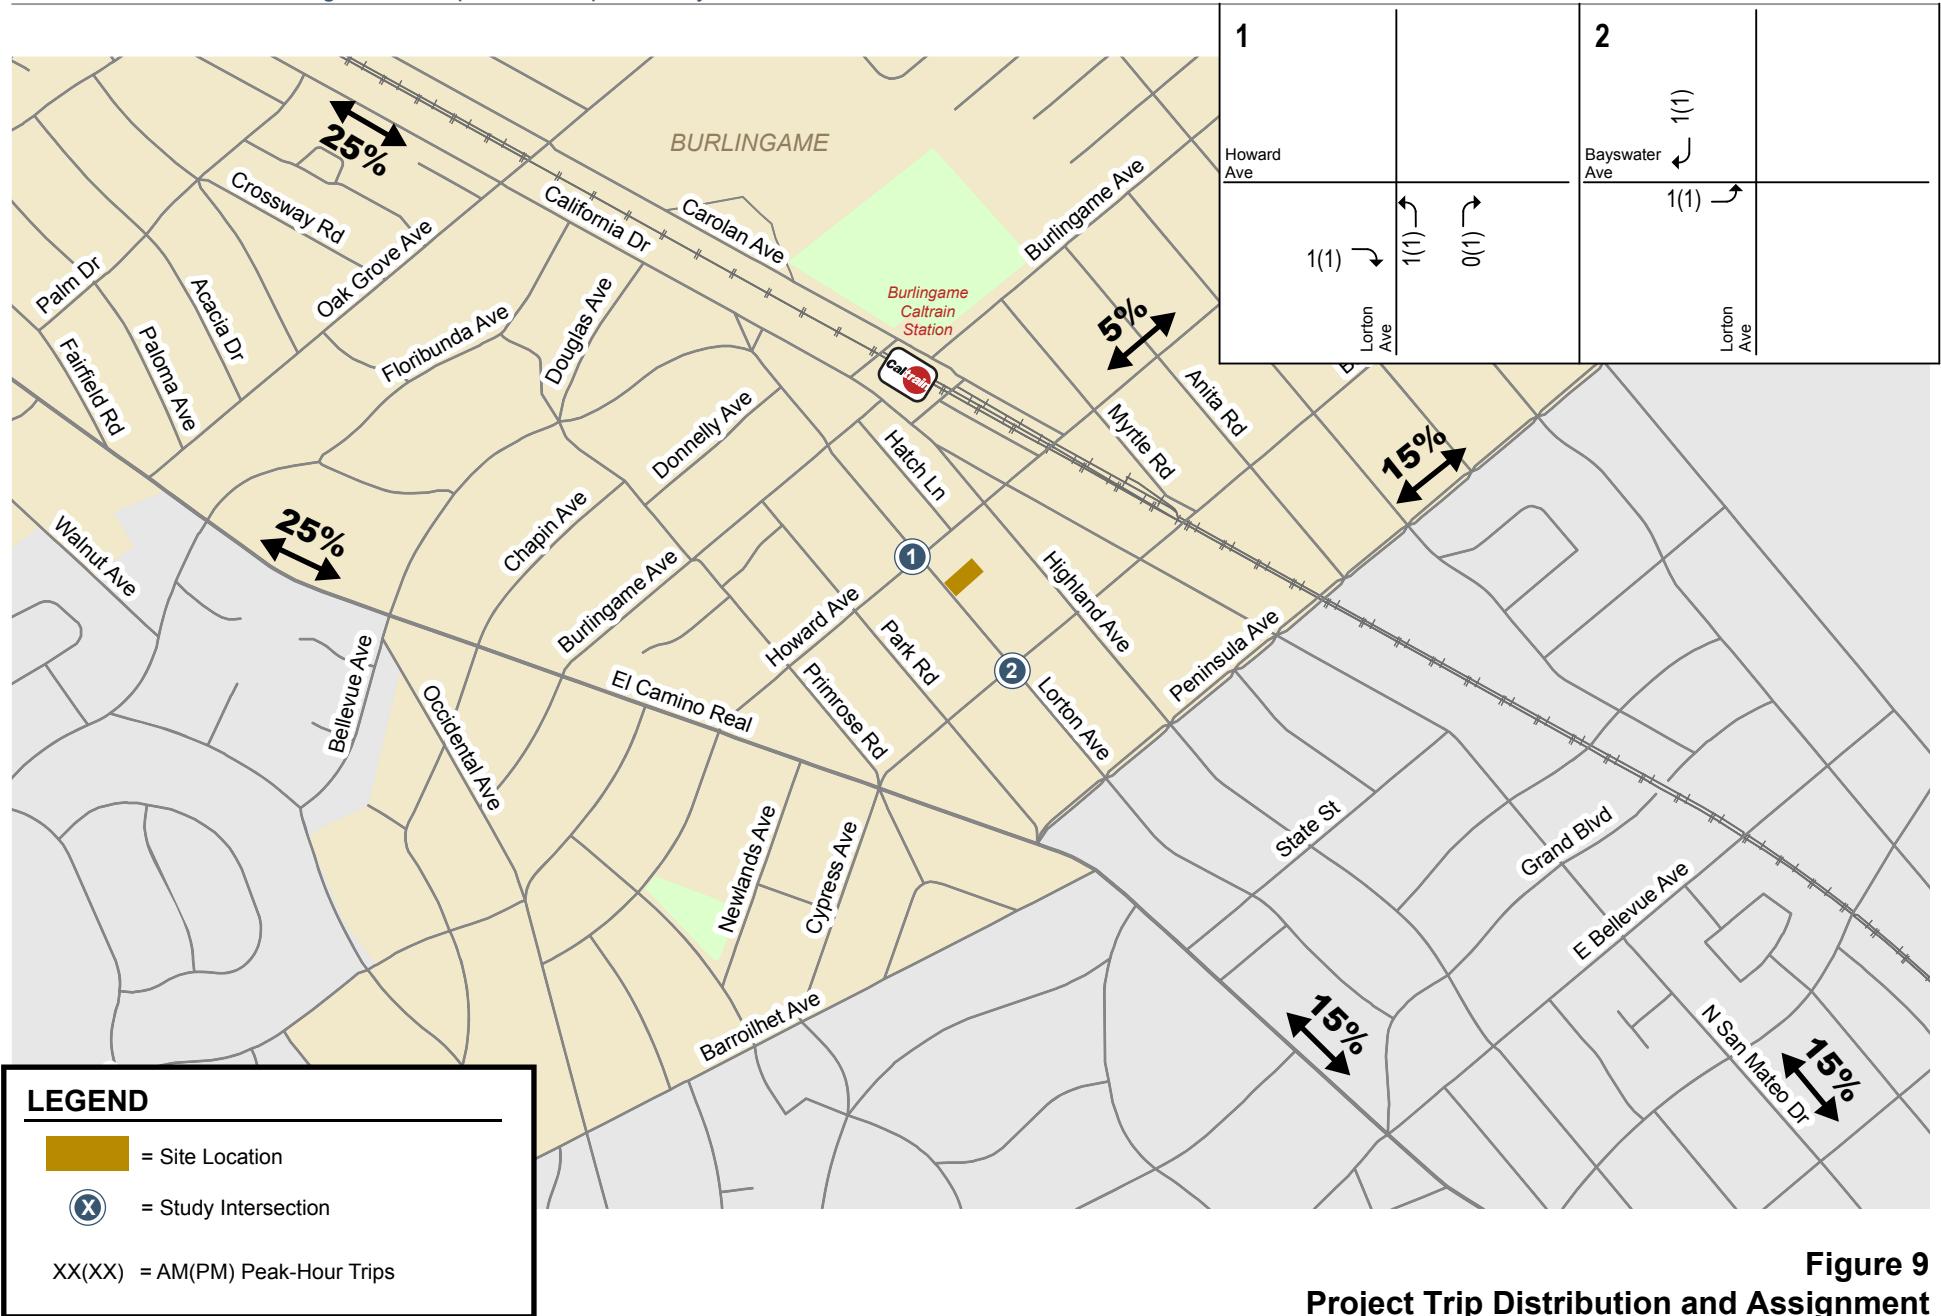

Figure 9
Project Trip Distribution and Assignment

128 Lorton Avenue at Burlingame Transportation Impact Analysis

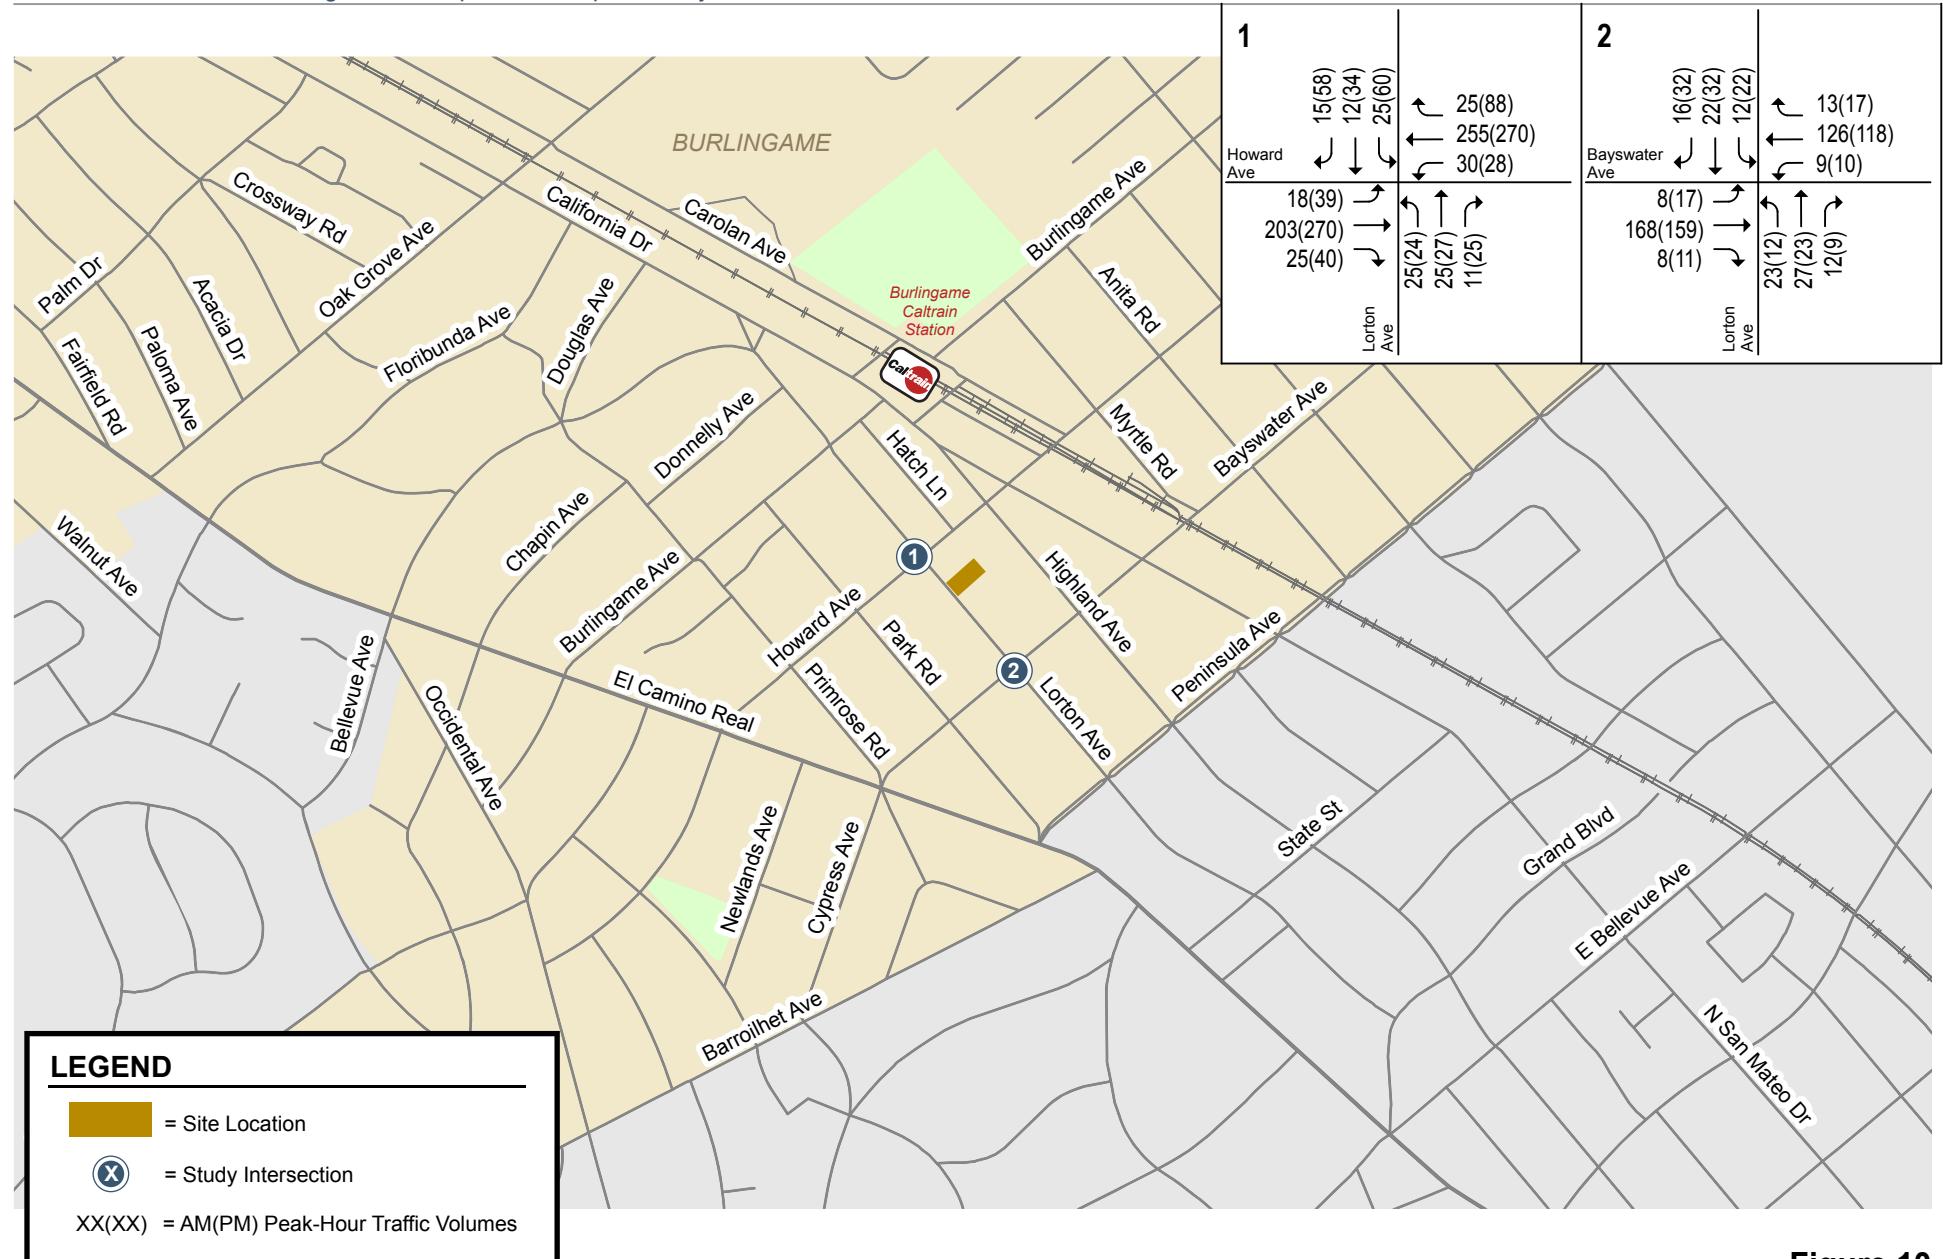

Figure 10
Existing Plus Project Traffic Volumes

Project Condition Traffic Volumes

Project trips, as represented in the above project trip assignment, were added to background traffic volumes to obtain project condition traffic volumes. The project condition traffic volumes at the study intersections are shown on Figure 11.

Project Condition Intersection Analysis

All the stop-controlled approaches of the unsignalized study intersections would continue to operate at LOS B or better during both peak hours (see Table 7). This indicates that, with the addition of project traffic under background conditions, vehicles at the stop-controlled approaches are expected continue to experience only minor delays.

Intersection level of service calculation sheets are provided in Appendix C. Traffic volumes for all components of traffic are tabulated in Appendix E.

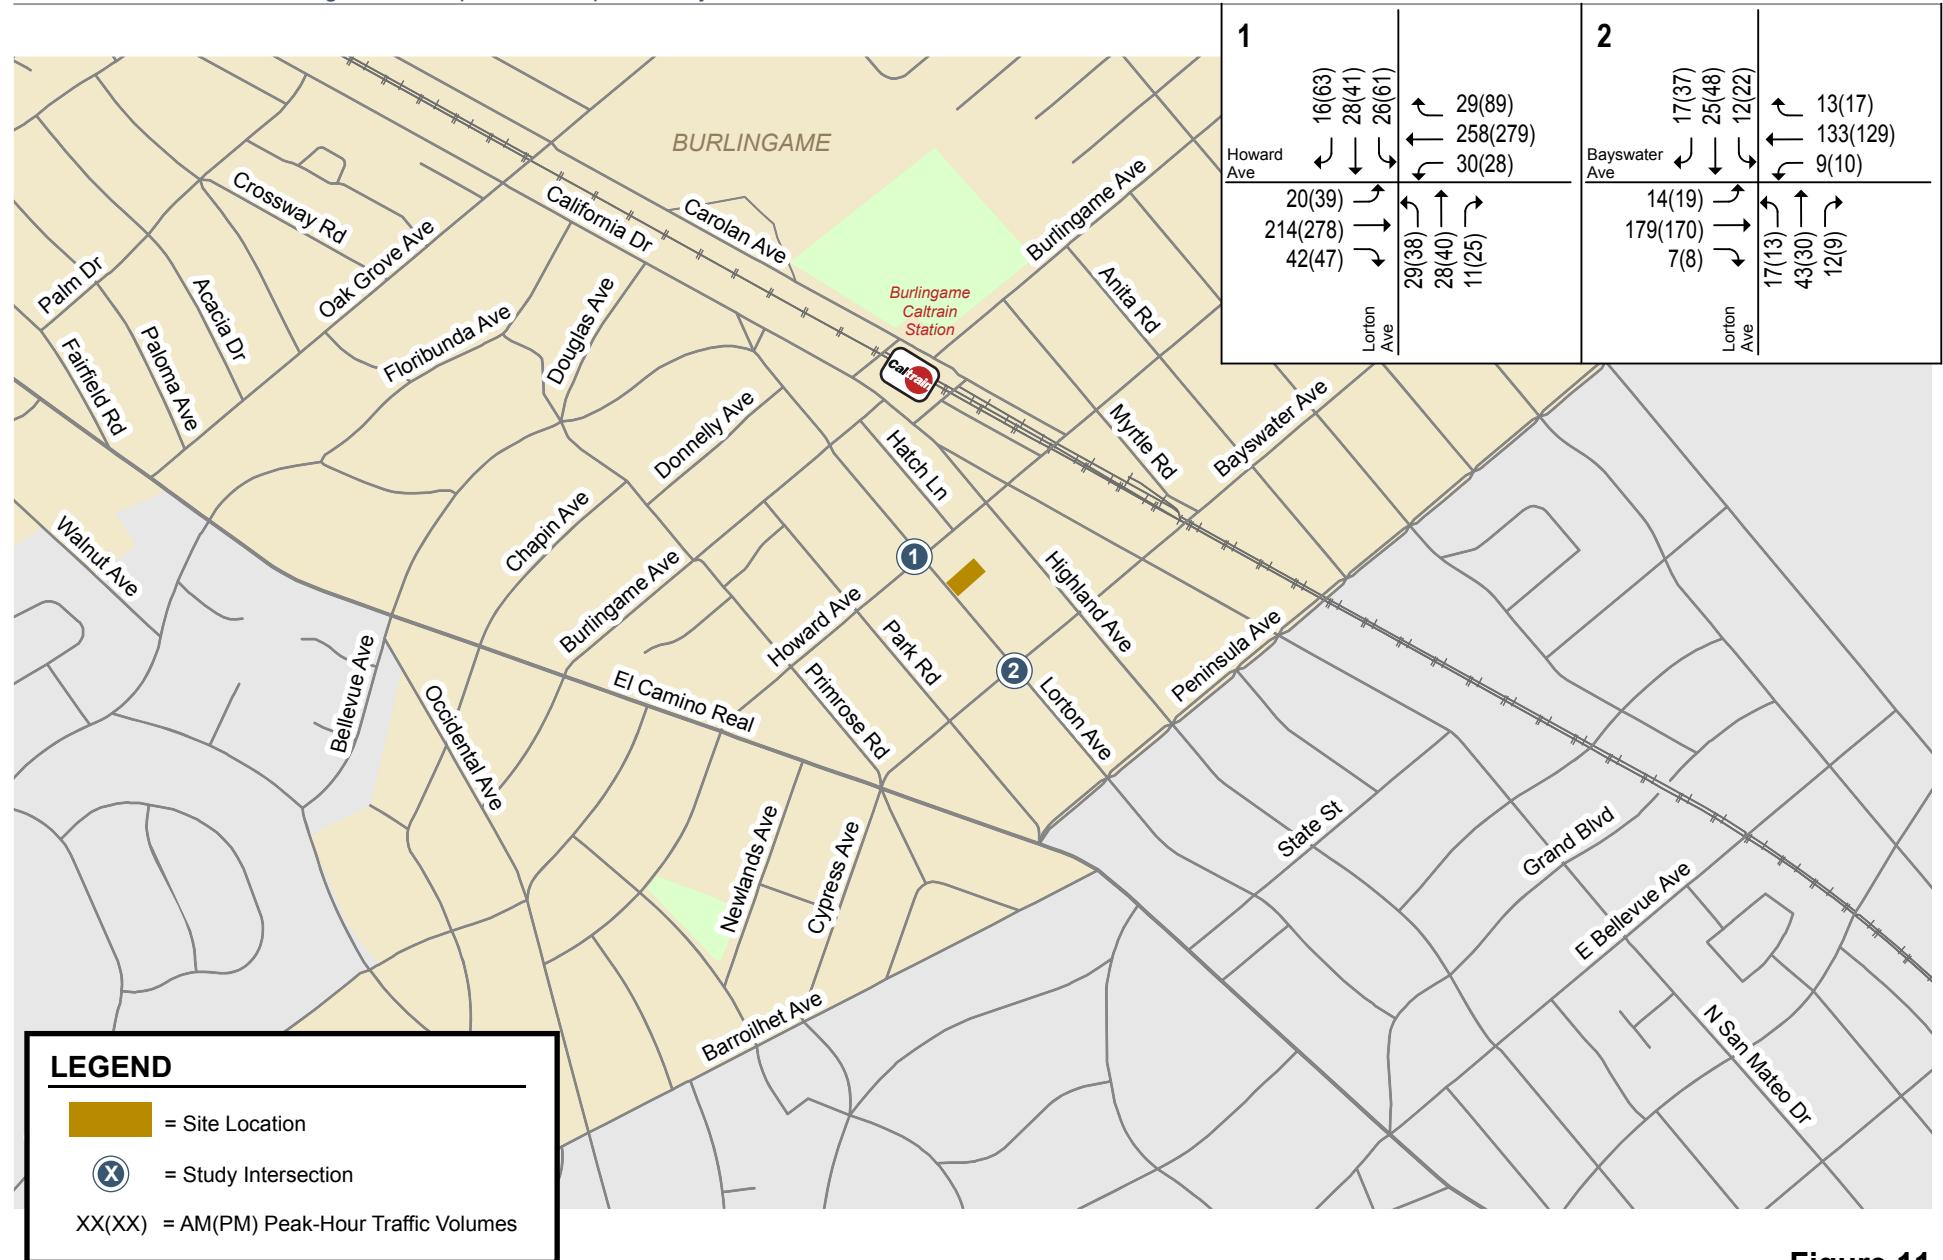

Figure 11
Background Plus Project Traffic Volumes

5. Cumulative Conditions

This chapter presents a summary of the traffic conditions that would occur under cumulative conditions with the proposed project. Cumulative conditions represent future traffic conditions with expected growth in the area. The expected future traffic growth was estimated by applying an annual growth factor to the existing counts over 10 years and then adding trips from approved developments. Thus, cumulative conditions reflect a horizon year of 2029.

Roadway Network and Traffic Volumes

The intersection lane configurations under cumulative conditions were assumed to be the same as described under background conditions.

Based on the C/CAG travel demand model, as well as previously completed traffic studies within the City of Burlingame, the traffic volumes under cumulative no project conditions for the study intersections were estimated by applying a 1.0 percent annual growth rate to the existing traffic counts and adding traffic from approved developments. The growth rate was applied to the study intersections through the year 2029 (ten-year horizon). Project trips were then added to the growth estimates to create the cumulative conditions volumes (see Figure 12).

Intersection Levels of Service Analysis

The results of the level of service analysis under cumulative conditions show that all the stop-controlled approaches of the unsignalized study intersections would operate at LOS B or C during both peak hours (see Table 8). This indicates that, even with the addition of project traffic and general future traffic growth in the area under cumulative conditions, vehicles at the stop-controlled approaches are expected to experience only moderate delays.

Level of service calculation sheets are included in Appendix C. Traffic volumes for cumulative conditions are tabulated in Appendix E.

128 Lorton Avenue at Burlingame Transportation Impact Analysis

TWSC = Two-Way Stop Control
¹ Average delay for an all-way stop controlled intersection is reported for the entire intersection.
² Average delay for a two-way stop controlled intersection is reported for the worst stop-controlled approach.

6. Other Transportation Issues

This chapter presents other transportation issues associated with the project. These include an analysis of:

- Project site access and circulation
- Truck access and circulation
- Parking analysis
- Signal warrant analysis
- Potential impacts to pedestrian, bicycle, and transit facilities

Unlike the level of service impact methodology, most of the analyses in this chapter are based on professional judgement in accordance with the standards and methods employed by traffic engineering professionals. Although operational issues are not considered CEQA impacts, they do describe traffic conditions that are relevant to describing the project environment.

Site Access and On-Site Circulation

The site access and on-site circulation evaluation is based on the March 15, 2019 site plan prepared by Architects Orange (see Figure 2). Site access was evaluated to determine the adequacy of the site's driveway with regard to the following: traffic volume, delays, vehicle queues, geometric design, and corner sight distance. On-site vehicular circulation was reviewed in accordance with generally accepted traffic engineering standards and transportation planning principles.

Project Driveway Design

Vehicular access to the project site would be provided via a single full-access driveway on Lorton Avenue. The project driveway is shown to be 12 feet wide and would provide access to the residential parking garage with 17 stalls. The City of Burlingame Zoning Code (25.70.025) requires a minimum of 12-feet driveway with not more than 30 vehicle spaces. Therefore, the project would meet the City's minimum width requirement for a two-way driveway. The driveway would not be wide enough for two vehicles to pass each other. Therefore, a vehicle entering would have to wait on Lorton Avenue if another vehicle was exiting. This would not be a problem because of the low volume and speed of traffic on Lorton Avenue.

Nearby Driveways

The location of the project driveway was also reviewed with respect to other driveways in the vicinity of the project site. There is a driveway immediately adjacent to the project driveway and a driveway across the street. Both driveways serve small apartment buildings. Because all driveways would have low volume, no conflicts are expected to occur.

The intersections along Lorton Avenue at Howard Avenue and Bayswater Avenue are located approximately 250 feet north and 300 south of the project driveway, respectively. While the project driveway would be somewhat close to the Lorton Avenue/Howard Avenue intersection, vehicle queues at the intersection are not expected to back-up to the driveway and block access to the project site.

Sight Distance

There are no existing trees or visual obstructions along the project frontage that could obscure sight distance at the project driveway. The project access points should be free and clear of any obstructions to provide adequate sight distance, thereby ensuring that exiting vehicles can see pedestrians on the sidewalk and vehicles and bicycles traveling on Lorton Avenue. Any landscaping and signage should be located in such a way to ensure an unobstructed view for drivers exiting the site.

Adequate sight distance (sight distance triangles) should be provided at the project driveway in accordance with Caltrans standards. There is a driveway to an apartment building immediately adjacent to the project driveway. This driveway provides a clear sight zone to the south of the site. Altogether, there is sight distance of about 100 feet in each direction from the parking garage entrance. This distance is adequate for a downtown setting. It is expected that vehicles are traveling slowly on Lorton Avenue. The edge of the proposed building would be five feet from the sidewalk, which would not allow vehicles exiting the garage to see pedestrians on the sidewalk and vice versa. Appropriate visible warning signs and audible warning signals should also be considered at the parking garage entrance to alert pedestrians and bicyclists of vehicles exiting the garage.

Project Driveway Operations

The project-generated gross trips that are estimated to occur at the project driveway are 2 inbound trips and 4 outbound trips during the AM peak hour, and 4 inbound trips and 3 outbound trips during the PM peak hour. Based on the relatively low traffic volumes near the project site and observations of existing traffic operations along Lorton Avenue, vehicle queues should rarely exceed one vehicle in length during the peak hours.

The project driveway would provide full-access, allowing right and left inbound and outbound turns to and from Lorton Avenue. Outbound left turns from the project driveway would require vehicles to wait for gaps in traffic in both the northbound and southbound directions, while inbound left turns would require vehicles to wait for a gap in the northbound traffic flow only. Given that Lorton Avenue consists of only one lane in each direction with no left-turn pockets, inbound left turns at the project driveway would be made from the through lane. Thus, there would be interruptions to the through traffic flow while left-turn vehicles wait for a gap in the on-coming traffic flow, albeit momentary. This condition is standard in downtown areas such as this.

A level of service analysis was conducted for left-turns at the project driveways to ensure that vehicles would operate without excessive delays or queues (see Table 9). Under all scenarios with project traffic, the project driveway would operate at LOS A or better during the AM and PM peak hours. This indicates that left-turning vehicles at the project driveway would experience minor delays and are expected to have a minimal effect on operations at the adjacent intersections.

Table 9
Project Driveway Levels of Service Summary

Study Number	Intersection	Movement	Peak Hour	Existing with Project		Background with Project		Cumulative with Project	
				Avg. Delay (sec.)	LOS	Avg. Delay (sec.)	LOS	Avg. Delay (sec.)	LOS
3	Project Driveway and Lorton Avenue	Inbound Left	AM	7.3	A	7.4	A	7.4	A
			PM	7.4	A	7.4	A	7.4	A
		Outbound Left	AM	8.8	A	9.0	A	9.0	A
			PM	8.9	A	9.0	A	9.1	A

On-Site Circulation

On-site vehicular circulation was reviewed in accordance with the City of Burlingame Zoning Code and generally accepted traffic engineering standards. In general, the proposed site plan would provide vehicle traffic with adequate connectivity through the parking areas. The project would provide 90-degree parking stalls throughout the parking garage. The City's standard minimum width for two-way drive aisles is 24 feet wide where 90-degree parking is provided. This allows sufficient room for vehicles to back out of the parking spaces. According to the site plan, the two-way drive aisles with parking available on one side measure 24 feet wide throughout the parking garage, providing adequate access to the parking stalls.

Parking Stall Dimensions

The City of Burlingame Zoning Code does not include standards for mechanical-stack parking systems. The project proposes to use a puzzle stacker system. It is not clear what dimensions of vehicle could be accommodated. The proposed puzzle stackers should be designed and installed to accommodate all typical passenger vehicles, including trucks, SUVs, and vans.

Parking Garage Circulation

The parking garage design shows two parking spaces at the end against the wall. A back-up space has been provided to allow those vehicles to turn around to exit the garage.

Within the parking garage, most of the parking spaces would consist of a mechanical-stack parking system. Comprised of eight (8) parking spaces plus one (1) open space, the vehicle stackers would present an open parking stall, that once occupied would automatically shift downward or rotate, presenting another open stall. This system would also allow residents to retrieve their vehicle without the need to move the other accompanying vehicles. Based on the project site plan, the parking garage shows adequate circulation.

Truck Access and Circulation

The project plans do not show a formal loading/unloading space, and the City code does not require one. Therefore, all residential loading and unloading activities, as well as truck deliveries, are expected to occur curbside along Lorton Avenue. Currently, Lorton Avenue along the project frontage provides metered on-street parking between 8 AM to 6 PM.

Garbage Collection

The site plan shows the trash room to be located in the northeast corner on the ground floor. Garbage collection activities for the project are not expected to occur on-site due to height and access

limitations. Therefore, it is assumed that trash bins would be wheeled out to the curb along Lorton Avenue on designated garbage collection days. Given that on-street parking is permitted along Lorton Avenue, signs prohibiting parking during garbage pickup hours should be placed adjacent to the building entrance. The trash bins also should be removed from the public right-of-way immediately after garbage pickup as to not impact AM or PM peak hour traffic conditions or reduce on-street parking.

Emergency Vehicle Access

Emergency vehicles access (EVA) would be provided from Lorton Avenue. Smaller emergency vehicles also would be able to access the parking garage.

Parking Supply

The City of Burlingame Zoning Code (Section 25.70.032) states that residential uses within the Burlingame Downtown Specific Plan Area are to provide parking as follows: 1.0 parking space per studio and one-bedroom unit, 1.5 parking spaces per two-bedroom unit and 2 parking spaces per three-bedroom unit. The project as proposed would construct 11 one-bedroom units, 7 two-bedroom units and one three-bedroom unit. Based on the City's parking requirements and the current project description, the project would be required to provide 24 parking spaces.

Based on the project site plan dated March 15, 2019, the parking garage would provide a total of 17 parking spaces; therefore, the proposed parking supply would not meet the City's Parking Code. The project should provide seven more parking spaces to meet the City's requirements. It is assumed that residential guests would utilize the public parking in the downtown area, including the on-street parking along the project frontage.

Per the California Building Code (CBC) Table 11B-6, one van accessible space is required for projects with 1 to 25 parking spaces. The plan shows one accessible space located adjacent to the garage entrance/exit. Thus, the project adheres to the CBC accessible parking provisions.

The City of Burlingame municipal code does not include standards for bicycle parking. No bicycle parking facilities are shown on the site plan. The project should add long-term bicycle parking spaces for residents and a bike rack for short-term visitor parking. Based on GreenTRIP guidelines, the project should provide at least one space per unit and one guest parking space for each 5 units. Therefore, the project should include 19 long term bicycle parking spaces and four short term spaces.

Signal Warrant Analysis

Signal warrant checks (California *MUTCD*, Section 4, *Warrant 3*) were performed for the unsignalized study intersections. The results of the signal warrant analysis are described and summarized below. Signal warrant worksheets and threshold tables are included in Appendix D.

Based on their peak-hour traffic volumes, the study intersections would not warrant signalization under any traffic scenario without and with the project.

Evaluation of The Village at Burlingame TIA Study Intersections

Twelve signalized intersections and four unsignalized intersections (including two 128 Lorton Avenue study intersections) were studied in the Village at Burlingame project. Based on the intersection level of service analysis study from the Village at Burlingame project, all but one of the study intersections would operate at an acceptable LOS D or better during both the AM and PM peak hours. The California Drive/Broadway intersection would operate at an unacceptable level of service (LOS E) during the AM

peak hour under all traffic scenarios. The 128 Lorton Avenue project would not add any trips to the intersections at Carolan Avenue/Broadway, Carolan Avenue/Oak Grove Avenue, California Drive/Bayswater Avenue and California Drive/Peninsula Avenue. The proposed project would add only one outbound trip during the PM peak hour to the intersections at California Driveway/Broadway, California Drive/Oak Grove Avenue, California Drive/Burlingame Avenue and California Drive/Howard Avenue. The 128 Lorton Avenue project would add a maximum of two trips (one inbound and one outbound trip) to the other intersections during the AM and PM peak hours. The addition of such a small number of trips would not change the operating conditions of any of the intersections.

Pedestrian, Bicycle, and Transit Analysis

All new development projects in the City of Burlingame should encourage multi-modal travel, consistent with the goals of the City's General Plan. It is the goal of the General Plan that all development projects accommodate and encourage the use of non-automobile transportation modes to achieve Burlingame's mobility goals. In addition, the adopted Bicycle Transportation Plan establishes goals and policies to make bicycling a daily part of life in Burlingame. The Transportation Plan includes designated bike lanes where possible, as well as designated routes for both local and regional trips, to provide a complete connection through Burlingame. In order to further the goals of the City, pedestrian and bicycle facilities should be encouraged with new development projects.

Pedestrian Facilities

Pedestrian facilities in the study area consist of sidewalks, crosswalks, and pedestrian signals at signalized intersections (see Chapter 2 for details). The project is expected to increase the number of pedestrians using the sidewalks and crosswalks. Project plans show existing sidewalks of approximately 5 feet in width along its Lorton Avenue frontage. The overall network of sidewalks and crosswalks in the vicinity of the project site has adequate connectivity and provides pedestrians with safe routes to transit services and other points of interest. Note that the project would not remove any pedestrian facilities, nor would it conflict with any adopted plans or policies for new pedestrian facilities.

Bicycle Facilities

There are some bike facilities in the immediate vicinity of the project site (see Chapter 2 for details).

Bicycles are also allowed on Caltrain and BART. The Burlingame Station is served by Caltrain (approximately a quarter mile north of the project site), while the Millbrae Station is served by Caltrain and BART (located about three miles from the project site). There are bicycle racks and bicycle lockers available at both transit stations.

Residents cycling to and from the site to the Burlingame Caltrain station could use Burlingame Avenue and Lorton Avenue. Although neither street is a designated bike route, due to low speed limit and traffic volume, both streets are conducive to bicycle travel.

The project would not remove any bicycle facilities, nor would it conflict with any adopted plans or policies for new bicycle facilities.

Transit Services

The project study area is well-served by SamTrans, Caltrain, and the Burlingame Trolley. The study area is served directly by two express bus route and two shuttle routes. The project would generate about 7 person-trips during the AM peak hour and 8 person-trips during the PM peak hour. Given the project site's proximity to transit services, it could be expected that a portion (10%) of residents' trips would be made by transit. Assuming up to 10% of the total trips are made by transit, that translates into

a maximum of about 1 new transit rider during the peak hours. It is assumed that the existing transit services have sufficient capacity to accommodate this minor increase in ridership.

The project would not remove any transit facilities, nor would it conflict with any adopted plans or policies associated with new transit facilities.

Future Transit Services

As previously mentioned, the PCEP is expected to increase service by up to six Caltrain trains per peak hour per direction by 2020. With the proposed electrification project, it is expected that the transit ridership at the Burlingame Station will increase. Given the nearby Caltrain station, development of this residential project would result in new transit riders, thus reducing vehicle trips. The Burlingame Station is within walking distance (approximately a quarter mile north of the project site). Bicycling to the site would also be a suitable option, given that the local streets between the Burlingame Station and the project site consist of low speed limits and traffic volumes which make them conducive to bicycle travel.

Appendix B

List of Approved Projects

Major Projects

Welcome to the Planning Division Major Projects page. Click on the tabs in the navigation menus below to access each list of projects and the individual project pages. The projects are sorted into four categories: **Approved Projects**, **Proposed Projects Under Review**, **City Planning Initiatives**, and **Preliminary Projects**.

The Planning Division maintains summaries of major development applications in separate commercial and residential application overview reports. Each report summarizes the status of approved and proposed projects, together with links to the project information web pages. Click on the links below to download each report:

- **Residential Applications Overview** - updated June 2019 (PDF)
- **Commercial Applications Overview** - updated June 2019 (PDF)

APPROVED PROJECTSCITY INITIATIVESPRELIMINARY PROJECTSPROPOSED PROJECTS

APPROVED PROJECTS

BAYSWATER AVENUE - 920 BAYSWATER AVENUE

An application has been submitted for a new four-story, 128-unit apartment development with below-grade at the corner of Bayswater Avenue and Myrtle Road within the Downtown Specific Plan planning area.

Appendix D

Signal Warrant Analysis

Lorton Avenue and Howard Avenue

TRAFFIC SIGNAL WARRANTS WORKSHEET

Major Street: Howard Avenue
 Minor Street: Lorton Avenue

Analyst: SS date: 7/15/19
 Critical Approach Speed* (mph) 25
 Critical Approach Speed* (mph) 25

*Posted Speed.

Critical speed of major street traffic > 50 mph (64 km/h).....
 or
 In built up area of isolated community of < 10,000 population.....
 Urban (U)

AM PEAK PERIOD**Warrant 3 - Peak Hour****PART A**

(All parts 1, 2, and 3 below must be satisfied)

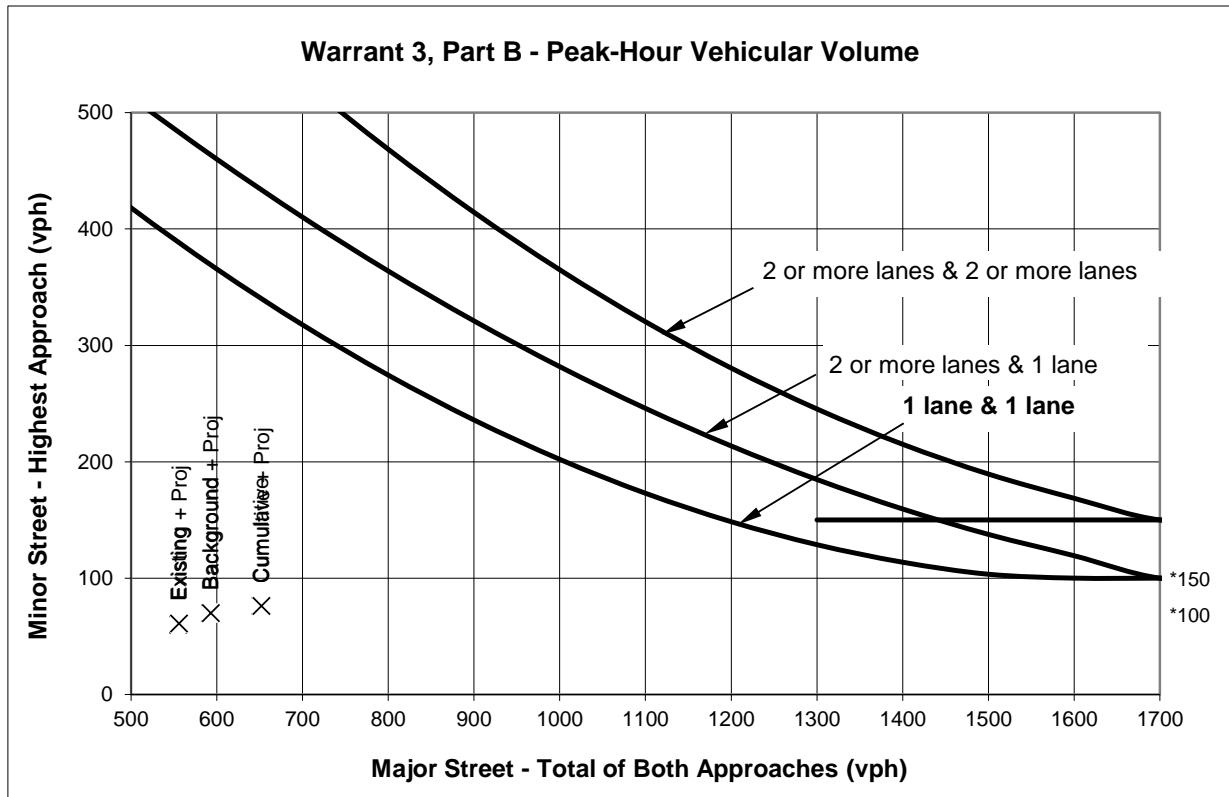

AM PEAK PERIOD						
	Existing	Background	Existing + Proj	Background + Proj	Cumulative	Cumulative + Proj
Minor Street Approach Direction w/ Highest Delay	NB	SB	NB	SB	SB	SB
Highest Minor Street Average Delay (sec/veh)	8.8	9.0	8.8	9.0	9.3	9.3
Corresponding Minor Street Approach Volume (veh/hr)	60	70	61	70	76	76
Minor Street Total Delay (veh-hrs)	0.1	0.2	0.1	0.2	0.2	0.2
1. The total delay experienced for traffic on one minor street approach controlled by a STOP sign equals or exceeds 4 vehicle-hours for a 1-lane approach and 5 vehicle-hours for a 2-lane approach; <u>AND</u>	No	No	No	No	No	No
2. The volume on the same minor street approach equals or exceeds 100 vph for 1 moving lane of traffic or 150 vph for 2 moving lanes; <u>AND</u>	No	No	No	No	No	No
3. The total entering volume serviced during the hour equals or exceeds 800 vph for intersections with 4 or more approaches or 650 vph for intersections with 3 approaches.	No	No	No	No	No	No
Signal Warranted based on Part A?	No	No	No	No	No	No

PART B

AM PEAK PERIOD						
	Approach Lanes	Existing	Background	Existing + Proj	Background + Proj	Cumulative
Major Street - Both Approaches	Howard Avenue	X	555	592	556	593
Minor Street - Highest Approach	Lorton Avenue	X	60	70	61	70
Signal Warranted based on Part B?	No	No	No	No	No	No

The Warrant is satisfied if the plotted point for vehicles per hour on the major street (both approaches) and the corresponding per hour higher vehicle volume minor street approach (one direction only) for one hour (any four consecutive 15-minute periods) fall above the applicable curves in California MUTCD Figure 4C-3 or 4C-4.

Source: California Manual on Uniform Traffic Control Devices for Streets and Highways (FHWA's MUTCD 2010 Edition, as amended for use in California).
 Notes:

*Lorton Avenue and Howard Avenue***Lorton Avenue and Howard Avenue****AM PEAK PERIOD**

Source: Figure 4C-3 *California Manual on Uniform Traffic Control Devices for Streets and Highways (FHWA's MUTCD 2010 Edition, as amended for use in California)*.

* Note: 150 vph applies as the lower threshold volume for a minor-street approach with two or more lanes and 100 vph applies as the lower threshold volume for a minor-street approach with one lane.

Warrant 3, Part B - Peak-Hour Vehicular Volume

		AM PEAK PERIOD								
		Approach Lanes		Existing	Background	Existing + Proj	Background + Proj	Cumulative	Cumulative + Proj	
		2 or One More								
Major Street - Both Approaches	Howard Avenue	X		555	592	556	593	651	652	
Minor Street - Highest Approach	Lorton Avenue	X		60	70	61	70	76	76	
Signal Warranted Based on Part B - Peak-Hour Volumes?		No	No	No	No	No	No	No	No	

*Warrant is satisfied if plotted points fall above the appropriate curve in graph above.

PM PEAK HOUR**Warrant 3 - Peak Hour****PART A**

(All parts 1, 2, and 3 below must be satisfied)

	PM PEAK HOUR					
	Existing	Background	Existing + Proj	Background + Proj	Cumulative	Cumulative + Proj
Minor Street Approach Direction w/ Highest Delay	SB	SB	SB	SB	SB	SB
Highest Minor Street Average Delay (sec/veh)	10.6	11.2	10.7	11.3	12.2	12.3
Corresponding Minor Street Approach Volume (veh/hr)	152	165	152	165	181	181
Minor Street Total Delay (veh-hrs)	0.4	0.5	0.5	0.5	0.6	0.6
1. The total delay experienced for traffic on one minor street approach controlled by a STOP sign equals or exceeds 4 vehicle-hours for a 1-lane approach and 5 vehicle-hours for a 2-lane approach; <u>AND</u>	No	No	No	No	No	No
2. The volume on the same minor street approach equals or exceeds 100 vph for 1 moving lane of traffic or 150 vph for 2 moving lanes; <u>AND</u>	Yes	Yes	Yes	Yes	Yes	Yes
3. The total entering volume serviced during the hour equals or exceeds 800 vph for intersections with 4 or more approaches or 650 vph for intersections with 3 approaches.	Yes	Yes	Yes	Yes	Yes	Yes
Signal Warranted based on Part A?	No	No	No	No	No	No

PART B

			PM PEAK HOUR					
		Approach Lanes	Existing	Background	Existing + Proj	Background + Proj	Cumulative	Cumulative + Proj
Major Street - Both Approaches	Howard Avenue	X	734	759	735	760	835	836
Minor Street - Highest Approach	Lorton Avenue	X	152	165	152	165	181	181
Signal Warranted based on Part B?		No	No	No	No	No	No	No

The Warrant is satisfied if the plotted point for vehicles per hour on the major street (both approaches) and the corresponding per hour higher vehicle volume minor street approach (one direction only) for one hour (any four consecutive 15-minute periods) fall above the applicable curves in California MUTCD Figure 4C-3 or 4C-4.
