Summary:
 5 trees were surveyed. 3 native oak trees were observed as well as one invasive acacia tree and a neighboring African fern pine tree. All of the trees except acacia tree #4 are of a protected size in the city of Burlingame. Non-protected Black Acacia tree #4 is proposed for removal due to the tree's location near the proposed driveway/grading.

Impacts/Recommendations:
Oak tree #1 is to be retained. The tree is adjacent to an existing driveway. It is recommended to temporarily retain the existing driveway near this tree when underneath the dripline of the tree during the building phase of the project. Temporarily retaining the driveway will act as a tree protection measure and will help to increase staging and access to the site, as removing the driveway at the beginning of the project would make for a larger tree protection zone needed with the fencing being located at the tree's drip line. The existing grade within the tree's dripline is recommended to be retained as is where possible. No grading or excavation is recommended to take place within 10' from this tree (6x diameter) except for the removal of the driveway. At the end of the project, when it is time to demolish the existing driveway near this tree, the Project Arborist is

recommended to be on-site to document and witness the removal of the driveway. A jackhammer is recommended to be used when working within the tree's drip line to break the concrete material into hand manageable-sized pieces. Once broken down the driveway material is recommended to be removed by hand. Exposed roots during the process are recommended to be wrapped in layers of wetted-down burlap to avoid root desiccation. The existing driveway area is recommended to be filled back in once the driveway has been removed so that no roots are exposed to the elements. When backfilling the soil in this area, the area is also to be irrigated. The proposed driveway is further from the tree than the existing driveway and outside of the 10' range and is not expected to have impacts on the tree. The tree is recommended to be deep water fertilized with Nutriroot once the work near the tree has taken place as a mitigation measure for any minor impacts that may take place.

Dear Ms. Ngo,

As requested on December 4th, 2023, Kieilty Arborist Services visited the above site to provide a Tree Inventory Report/Tree Protection Plan for the proposed construction. 3 new homes are proposed for this site, and your concern as to the future health and safety of the tree has prompted this visit. Preliminary landscape plans L1 through L7 dated January 2024, lot 1 site plans A.1 through A.6 dated 10/26/22, lot 2 site plans A.1 through A.6 dated 10/26/21, and lot 3 plans A.1 through A.8 dated 10/26/21 were also reviewed for writing this report. This Tree Inventory Report is not a Tree Risk Assessment. As such, no trees were assessed for risk in accordance with industry standards, nor are there any tree risk ratings or risk mitigation recommendations provided within this preservation plan.

Method:

All inspections were made from the ground; the trees were not climbed for this inspection. The trees in question were located on an existing topography map provided by you. The trees were then measured for diameter at 54 inches above ground level (DBH or diameter at breast height). A condition rating (CON) is provided using 50 percent vitality and 50 percent form, using the following scale.

1	-	29	Very Poor
30	-	49	Poor
50	-	69	Fair
70	-	89	Good
90	-	100	Excellent

The height of the trees was measured using a Nikon Forestry 550 Hypsometer. The spread was paced off (HT/SP). Comments and recommendations for future maintenance are provided.

Survey Key:

DBH-Diameter at breast height (54" above grade) **CON- Condition rating (1-100)**

HT/SP- Tree height/ canopy spread *indicates neighbor's trees

P-Indicates protected tree by city ordinance

R-Indicates proposed tree removal

ARBORIST REPORT

Plan change needed:
A new pathway is proposed at 4' from oak tree #10. This is too close to the tree and impacts would be expected. It is recommended to maintain a minimal clearance of 10' from the tree to the pathway to keep impacts on the tree low. With this plan change implemented, impacts are expected to be minor and will be mitigated by the recommended deep water fertilizing with Nutriroot.

Showing the walkway at 4' from the tree

A new pathway is shown adjacent to valley oak tree #2. It is recommended to have the pathway no closer to the tree than the existing pathway next to the tree. This may result in a plan change. All landscaping work below the dripline of the tree is recommended to be done by hand under the direct supervision of the project arborist. Excavation is recommended not to exceed 6" for any landscaping when underneath the tree's dripline. No roots measuring larger than 1.5" in diameter shall be cut for landscaping purposes. No grading shall also take place underneath the tree's dripline.

Many existing landscape features exist at the back of the property near the retained trees. Any existing hardscapes to be removed are recommended to be carefully removed under the Project Arborist supervision. No excavation beyond hardscape removal is recommended when within 6x the diameter of a retained tree on site. The following Tree Protection Plan will reduce the impacts to the retained trees during the construction process.

Tree Protection Plan:

Tree Protection Zones

Tree protection zones should be installed and maintained throughout the entire length of the project. Fencing for tree protection zones on this site will consist of the existing property line fences as the only trees protected are the neighboring trees. For any non-protected trees desired to be protected from construction activity, the following recommendations should be followed: Tree protection fencing should be 6' tall, metal chain link material supported by metal 2" diameter poles, pounded into the ground to a depth of no less than 2'. No equipment or materials shall be stored or cleaned inside the protection zones. Areas where tree protection fencing needs to be reduced for access or any other reason, should be mulched with 6" of coarse wood chips with ½ inch plywood on top. The plywood boards should be attached together in order to minimize movement. The spreading of chips will help to reduce compaction and improve soil structure. All tree protection measures must be installed prior to any demolition or construction activity at the site. Whenever tree protection fencing needs to be moved or reduced for work to

1385 Hillside

(5)

take place, the Project Arborist shall be called out to the site to witness the moving of the fencing and to provide any other necessary protection measures as seen fit.

Avoid the following conditions:

DO NOT:

- Allow run off of spillage of damaging materials into the area below any tree canopy.
- Store materials, stockpile soil, or park or drive vehicles within the TPZ.
- Cut, break, skin, or bruise roots, branches, or trunks without first obtaining authorization from the Arborist.
- Allow fires under and adjacent to trees.
- Discharge exhaust into foliage.
- Secure cable, chain, or rope to trees or shrubs.
- Trench, dig, or otherwise excavate within the dripline or TPZ of the tree(s) without first obtaining authorization from the Arborist.
- Apply soil sterilant under pavement near existing trees.

Landscape Barrier

Where tree protection does not cover the entire root zone of the trees, or when a smaller tree protection zone is needed for access, a landscape barrier consisting of wood chips spread to a depth of four to six inches with plywood or steel plates placed on top will be placed where foot traffic is expected to be heavy. The landscape buffer will help to reduce compaction to the unprotected root zone. If plywood is to be used, the plywood pieces shall be attached together to minimize movement.

Landscape barrier example

Root Cutting and Grading

Any roots to be cut shall be monitored and documented. Large roots (over 2" diameter) or large masses of roots to be cut must be inspected by the site arborist. The Project Arborist, at this time, may recommend irrigation or fertilization of the root zone. All roots needing to be cut should be cut clean with a saw or loppers. Roots to be left exposed for a period should be covered with layers of burlap and kept moist to avoid root desiccation. Immediate irrigation is recommended within the tree protection zones whenever roots are impacted.

1385 Hillside

(6)

Trenching and Excavation

Trenching for irrigation, drainage, electrical or any other reason shall be done by hand when inside the dripline of a protected tree. Hand digging and the careful placement of pipes below or besides protected roots will significantly reduce root loss, thus reducing trauma to the tree. All trenches shall be backfilled with native materials and compacted to near its original level, as soon as possible. Trenches to be left open for a period of time, will require the covering of all exposed roots with burlap. The exposed roots will need to be kept moist by spraying down the burlap multiple times a day with clean water. The trenches will also need to be covered with plywood to help protect the exposed roots.

Irrigation

Normal irrigation shall be maintained on this site for the retained imported trees. Every two weeks during the dry season the trees shall receive supplemental irrigation. No irrigation to the native oak trees is needed unless roots are to be tramatized.

Construction projects are required to implement the stormwater best management practices (BMP) on this page, as they apply to your project, all year long.

- ☐ Berm and cover stockpiles of sand, dirt or other construction material with tarps when rain is forecast or if not actively being used within 14 days.
- ☐ Use (but don't overuse) reclaimed water for dust control.

- ❑ Label all hazardous materials and hazardous wastes (such as pesticides, paints, thinners, solvents, fuel, oil, and antifreeze) in accordance with city, county, state and federal regulations.
- ❑ Store hazardous materials and wastes in water tight containers, store in appropriate secondary containment, and cover them at the end of every work day or during wet weather or when rain is forecast.
- ❑ Follow manufacturer's application instructions for hazardous materials and be careful not to use more than necessary. Do not apply chemicals outdoors when rain is forecast within 24 hours.
- ❑ Arrange for appropriate disposal of all hazardous wastes.

- ❑ Cover waste disposal containers securely with tarps at the end of every work day and during wet weather.
- ❑ Check waste disposal containers frequently for leaks and to make sure they are not overfilled. (Never hose down a dumpster on the construction site.
- ❑ Clean or replace portable toilets, and inspect them frequently for leaks and spills.
- ❑ Dispose of all wastes and debris properly. Recycle materials and wastes that can be recycled (such as asphalt, concrete, aggregate base materials, wood, gyp board, pipe, etc.)
- ❑ Dispose of liquid residues from paints, thinners, solvents, glues, and cleaning fluids as hazardous waste.

- ❑ Establish and maintain effective perimeter controls and stabilize all construction entrances and exits to sufficiently control erosion and sediment discharges from site and tracking off site.
- ❑ Sweep or vacuum any street tracking immediately and secure sediment source to prevent further tracking. Never hose down streets to clean up tracking.

- ❑ Designate an area, fitted with appropriate BMPs, for vehicle and equipment parking and storage.
- ❑ Perform major maintenance, repair jobs, and vehicle and equipment washing off site.
- ❑ If refueling or vehicle maintenance must be done onsite, work in a bermed area away from storm drains and over a drip pan big enough to collect fluids. Recycle or dispose of fluids as hazardous waste.
- ❑ If vehicle or equipment cleaning must be done onsite, clean with water only in a bermed area that will not allow rinse water to run into gutters, streets, storm drains, or surface waters.
- ❑ Do not clean vehicle or equipment onsite using soaps, solvents, degreasers, steam cleaning equipment, etc.

- ❑ Keep spill cleanup materials (rags, absorbents, etc.) available at the construction site at all times.
- ❑ Inspect vehicles and equipment frequently for and repair leaks promptly. Use drip pans to catch leaks until repairs are made.
- ❑ Clean up spills or leaks immediately and dispose of cleanup materials properly.
- ❑ Do not hose down surfaces where fluids have spilled. Use dry cleanup methods (absorbent materials, cat litter, and/or rags).
- ❑ Sweep up spilled dry materials immediately. Do not try to wash them away with water, or bury them.
- ❑ Clean up spills on dirt areas by digging up and properly disposing of contaminated soil.
- ❑ Report significant spills immediately. You are required by law to report all significant releases of hazardous materials, including oil. To report a spill: 1) Dial 911 or your local emergency response number, 2) Call the Governor's Office of Emergency Services Warning Center, (800) 852-7550 (24 hours).

A black and white line drawing showing four workers in overalls and hard hats. They are laying a long, flexible pipe into a trench. One worker is at the left end, another is in the middle, and two are at the right end, one using a shovel. The trench is filled with soil and some vegetation is visible on the right side.

- ❑ Schedule grading and excavation work for dry weather only.
- ❑ Stabilize all denuded areas, install and maintain temporary erosion controls (such as erosion control fabric or bonded fiber matrix) until vegetation is established.
- ❑ Seed or plant vegetation for erosion control on slopes or where construction is not immediately planned.

- ☐ Protect storm drain inlets, gutters, ditches, and drainage courses with appropriate BMPs, such as gravel bags, fiber rolls, berms, etc.
- ☐ Prevent sediment from migrating offsite by installing and maintaining sediment controls, such as fiber rolls, silt fences, or sediment basins.
- ☐ Keep excavated soil on the site where it will not collect into the street.
- ☐ Transfer excavated materials to dump trucks on the site, not in the street.
- ☐ Contaminated Soils
 - ☐ If any of the following conditions are observed, test for contamination and contact the Regional Water Quality Control Board:
 - Unusual soil conditions, discoloration, or odor.
 - Abandoned underground tanks.
 - Abandoned wells
 - Buried barrels, debris, or trash.

- ❑ Avoid paving and seal coating in wet weather, or when rain is forecast before fresh pavement will have time to cure.
- ❑ Cover storm drain inlets and manholes when applying seal coat, tack coat, slurry seal, fog seal, etc.
- ❑ Collect and recycle or appropriately dispose of excess abrasive gravel or sand. Do NOT sweep or wash it into gutters.
- ❑ Do not use water to wash down fresh asphalt concrete pavement.

- ❑ Completely cover or barricade storm drain inlets when saw cutting. Use filter fabric, catch basin inlet filters, or gravel bags to keep slurry out of the storm drain system.
- ❑ Shovel, absorb, or vacuum saw-cut slurry and dispose of all waste as soon as you are finished in one location or at the end of each work day (whichever is sooner!).
- ❑ If sawcut slurry enters a catch basin, clean it up immediately.

- ❑ Store concrete, grout and mortar under cover, on pallets and away from drainage areas. These materials must never reach a storm drain.
- ❑ Wash out concrete equipment/trucks offsite or in a contained area, so there is no discharge into the underlying soil or onto surrounding areas. Let concrete harden and dispose of as garbage.
- ❑ Collect the wash water from washing exposed aggregate concrete and remove it for appropriate disposal offsite.

- ❑ Effectively manage all run-on, all runoff within the site, and all runoff that discharges from the site. Divert run-on water from offsite away from all disturbed areas or otherwise ensure compliance.
- ❑ When dewatering, notify and obtain approval from the local municipality before discharging water to a street gutter or storm drain. Filtration or diversion through a basin, tank, or sediment trap may be required.
- ❑ In areas of known contamination, testing is required prior to reuse or discharge of groundwater. Consult with the Engineer to determine whether testing is required and how to interpret results. Contaminated groundwater must be treated or hauled off-site for proper disposal.

- ❑ Never clean brushes or rinse paint containers into a street, gutter, storm drain, or surface waters.
- ❑ For water-based paints, paint out brushes to the extent possible. Rinse to the sanitary sewer once you have gained permission from the local wastewater treatment authority. Never pour paint down a drain.
- ❑ For oil-based paints, paint out brushes to the extent possible and clean with thinner or solvent in a proper container. Filter and reuse thinners and solvents. Dispose of residue and unusable thinner/solvents as hazardous waste.

- ❑ Chemical paint stripping residue and chips and dust from marine paints or paints containing lead or tributyltin must be disposed of as hazardous waste.
- ❑ Paint chips and dust from non-hazardous dry stripping and sand blasting may be swept up or collected in plastic drop cloths and disposed of as trash.

- ❑ Contain stockpiled landscaping materials by storing them under tarps when they are not actively being used.
- ❑ Stack erodible landscape material on pallets. Cover or store these materials when they are not actively being used or applied.
- ❑ Discontinue application of any erodible landscape material within 2 days before a forecast rain event or during wet weather.

Storm drain polluters may be liable for fines of up to \$10,000 per day!
